

Track views/faves/comments on a DeviantArt gallery, and post to it.

Analytics + Posting

Medium Setup

[Open this guide as a PDF ↗](#)

## WHAT YOU'LL NEED

---

- A DeviantArt account
- A DeviantArt "app" you register yourself — free, about two minutes

## STEP BY STEP

---

1

## Sign in to DeviantArt

Sign in at [deviantart.com](https://deviantart.com) in a desktop browser — the username comes first, then **Next** asks for the password. Everything below happens while signed in as the account you want tracked. [deviantart.com](https://deviantart.com) ↗

 Continue with Facebook

Become a Deviant [Join DeviantArt](#)

By logging in, I accept DeviantArt's [Terms of Service](#), and I acknowledge reading the [Privacy Policy](#).

## 2 Register a DeviantArt app

Open **Applications** (under Developers) and press **Register Application**. Any name will do — "PawPoller" is fine. Set **Client type** to **Confidential**, accept the terms, and save. [DeviantArt Applications](#) ↗

## 3 Copy the two codes it gives you

The app's page shows a `client_id` (a short number) and a `client_secret` (a long string). You will paste both into PawPoller. Treat the secret like a password.

## 4 Connect in PawPoller

In **Settings** → **DeviantArt**, paste the `client_id`, the `client_secret` and the DeviantArt **username to track**, then press **Connect**. Stats arrive on the next check.

## 5 Only if you want to post: allow it

Press **Authorise posting** and approve on DeviantArt. ⚠ DeviantArt approves **whichever account that browser is signed in to** — not the one you pressed the button for. With more than one account, open a private window, sign in as the right one, and press it there.

## 6 Add the return address to your app

DeviantArt only comes back to an address listed on your app, and it is the **address you opened PawPoller at** plus `/api/da/auth/callback`. Pressing **Authorise posting** prints the exact line to copy. Paste it into **Applications** → **Edit** → **OAuth2 Redirect URI Whitelist**, save there, then press the button again. Typical ones: `http://127.0.0.1:8420/api/da/auth/callback` for the desktop app, `https://yourmachine.your-tailnet.ts.net/api/da/auth/callback` over Tailscale, `https://pawpoller.yourdomain.com/api/da/auth/callback` on your own web address. Open PawPoller two ways and you need both lines — the list takes as many as you like.

## WHERE IT GOES IN PAWPOLLER

Settings → DeviantArt → `client_id` + `client_secret` + username to track

## KEEPING IT ALIVE

**Posting stops working (tracking keeps going).** Press Authorise posting again. The app's own codes do not expire.

## GOOD TO KNOW

- No browser cookie any more (since 2.47.0): this uses DeviantArt's official API, so there is nothing to copy out of DevTools and nothing that expires every few weeks. If a guide still tells you to fetch an `auth` cookie, it is out of date.
- Tracking needs only the app. Posting as you needs the extra approval, which is the only way DeviantArt will issue that permission.
- On a server, DA is polled through the Cloudflare proxy — data-centre addresses are blocked.
