

Track note counts and post to Tumblr.

Analytics + Posting

Medium Setup

[Open this guide as a PDF ↗](#)

WHAT YOU'LL NEED

- A registered Tumblr app (OAuth Consumer Key)
- Your blog name
- For posting: the full OAuth1 token set

STEP BY STEP

1

Register a Tumblr app

Go to the Tumblr apps page and **Register application**. [Tumblr OAuth apps ↗](#)

Applications

+ Register application

About Tumblr OAuth

Tumblr supports OAuth 1.0a, accepting parameters via the Authorization header, with the HMAC-SHA1 signature method only. There's probably already an OAuth client library for your platform.

If you've worked with Twitter's OAuth implementation, you'll feel right at home with ours.

Request-token URL:

POST https://www.tumblr.com/oauth/request_token

Authorize URL:

<https://www.tumblr.com/oauth/authorize>

Access-token URL:

POST https://www.tumblr.com/oauth/access_token

Rate Limits

Newly registered consumers are rate limited to 1,000 requests per hour, and 5,000 requests per day. If your application requires more requests for either of these periods, please use the *'Request rate limit removal'* link on an app above.

Tumblr's Applications page with the Register application button

2

Fill in the form

Name and describe the app, give any website and callback URL you own (they are never called), and register it.

Register your application

* Application Name:

* Application Website:

App Store URL:

Google Play Store URL:

* Application Description:
400 characters max

* Administrative contact email:
This won't be made public

* Default callback URL:

* OAuth2 redirect URLs (space separate):

Register your application: name, website, description, contact e-mail (blurred here), callback URL

3

Copy the OAuth Consumer Key

That key is your **API key** — enough for polling notes.

4

(For posting) get OAuth1 tokens

Posting also needs the **consumer secret** plus a user **OAuth token** + **token secret** (generated via the OAuth1 flow).

5

Connect in PawPoller

Enter the API key and your blog name (and the OAuth1 tokens if posting) in Settings.

WHERE IT GOES IN PAWPOLLER

Settings → Tumblr → API key + Blog name (+ OAuth1 tokens for posting)

KEEPING IT ALIVE

Keys/tokens are long-lived — only if you delete the app. Re-register the app and paste the new key/tokens.

GOOD TO KNOW

- Polling needs only the API key + blog name. **Posting** needs the extra OAuth1 token set.
- Tumblr reports a single "notes" number (likes + reblogs + replies combined).
