PAWPOLLER · GETTING STARTED GUIDE

FurAffinity

Track your FA gallery stats via your session cookies.

Analytics + Posting | Medium Setup

Open this guide as a PDF ↗

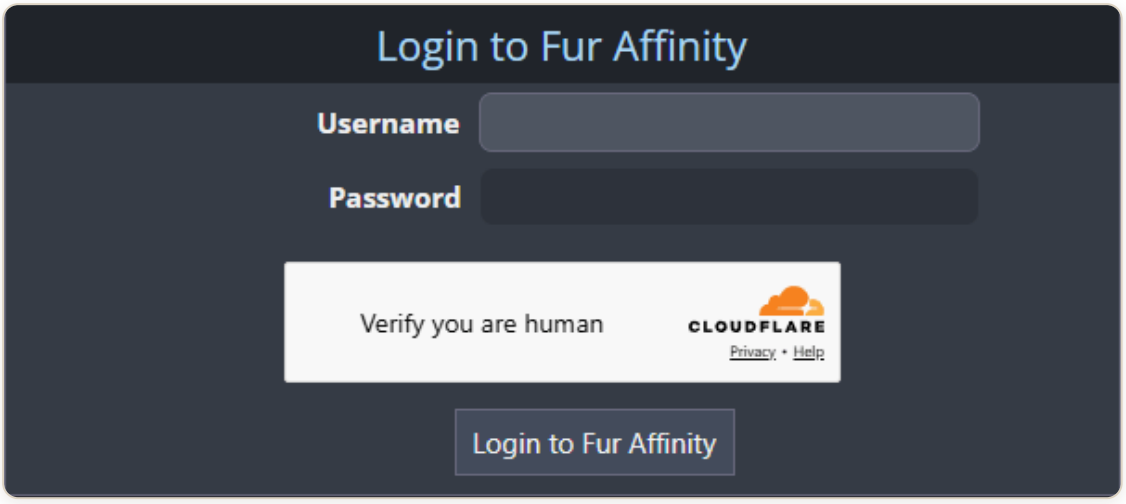

WHAT YOU'LL NEED

- A FurAffinity account
- Your logged-in cookies (a and b)

STEP BY STEP

1 Log into FurAffinity

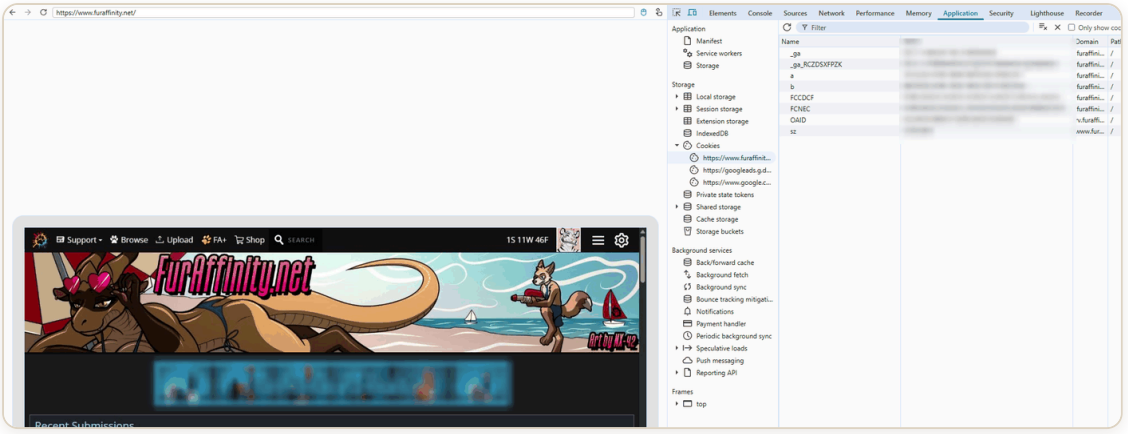

Sign in at furaffinity.net in a desktop browser. furaffinity.net ↗

FurAffinity's login form: Username, Password and the Cloudflare human check under them

2 Copy the a and b cookies

To read a cookie: log in on a desktop browser, press **F12** to open DevTools, go to **Application** (Chrome/Edge) or **Storage** (Firefox) → **Cookies** → the site, then copy the **Value** of each named cookie. You need the two cookies named `a` and `b`.

FurAffinity with DevTools open on Application → Cookies, the a and b rows named, their values blurred here

3 Connect in PawPoller

Paste the `a` and `b` values into the FurAffinity fields in Settings.

WHERE IT GOES IN PAWPOLLER

Settings → FurAffinity → Cookie a + Cookie b

KEEPING IT ALIVE

Cookies expire when you log out or after a while — polling starts failing with an auth error. Log back into FA, grab fresh `a` and `b` cookies, and paste them again.

GOOD TO KNOW

- Posting works from the server as well as the desktop app, as long as the two cookies are fresh. A post that fails with "not logged in" means they expired: copy them again.
- Journals: FurAffinity asks for a CAPTCHA on every journal, so PawPoller can't post them. Posts → **New journal**: in the desktop app, **Open FurAffinity, filled in** opens FA's journal page with everything filled in, so you only tick the CAPTCHA and press Post. In a browser, **Copy for FurAffinity** copies the FA version to paste.
- An official FA API is in closed beta and will replace cookies eventually.
