PAWPOLLER · GETTING STARTED GUIDE

Facebook

Post your art, GIFs, videos and updates to a Facebook Page you run, see each post's views, reactions, comments and shares, and answer comments from the Inbox.

Posting + Analytics | Involved Setup

Open this guide as a PDF ↗

WHAT YOU'LL NEED

- A Facebook **Page** you manage — apps can't post to a personal profile
- A free Meta developer app — the same one you use for Instagram or Threads is fine
- About 15 minutes, on a computer (not a phone)
- A web address for a privacy policy, which Facebook asks for before your posts can be public. PawPoller's own page works: `https://pawpoller.com/privacy/`

STEP BY STEP

1 **Make sure you have a Page**

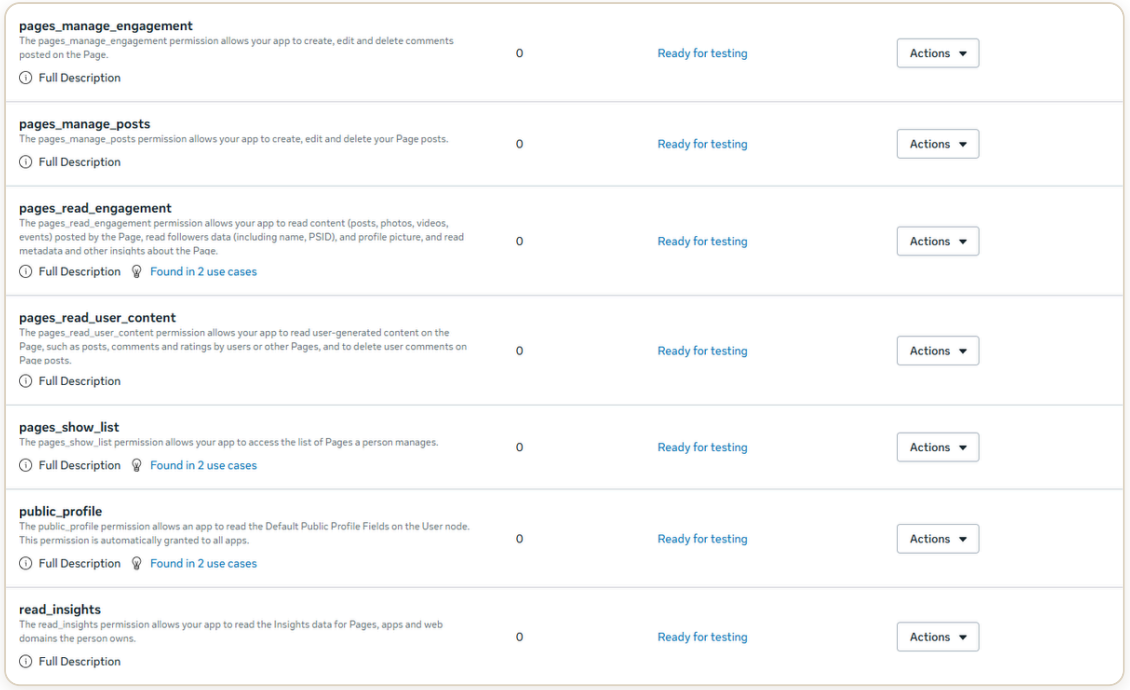

On Facebook, open **Pages** in the menu. If your Page is listed under *Pages you manage*, you're set. If not, press **Create Page** and follow Facebook's steps. You need full control of the Page (Facebook calls it *Facebook access*).
facebook.com/pages ↗

2 **Open your Meta developer app**

Go to **My Apps** on Meta for Developers. If you already made an app for Instagram or Threads, open it. If not, press **Create app**, give it any name, and finish the steps. You don't need a business portfolio.
developers.facebook.com/apps ↗

3 Add the Pages permissions

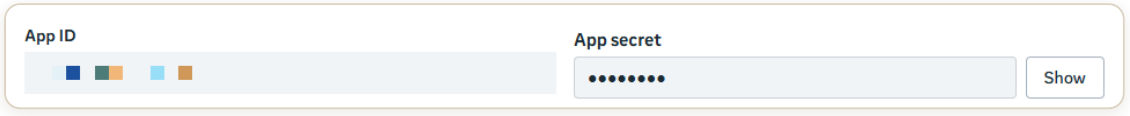

In the app, open **Use cases**. Find **Manage everything on your Page** (if it isn't there, press **Add use cases** and choose it) and press **Customize**. On the **Permissions** list, press **Add** next to each of these six: `pages_show_list`, `pages_read_engagement`, `pages_manage_posts`, `read_insights`, `pages_read_user_content` and `pages_manage_engagement`. The first three let PawPoller post; `read_insights` brings back views and reactions, `pages_read_user_content` brings comments into your Inbox, and `pages_manage_engagement` lets you reply to them. If Meta says the permission is also used by another use case (Instagram, say), press **Add** again. Each one then says **Ready for testing**. If Meta says *Sorry, something went wrong*, press **Add** again; it sometimes takes a couple of tries.

The Pages permissions list: each of the six permissions says Ready for testing

4 Copy your App ID and App secret

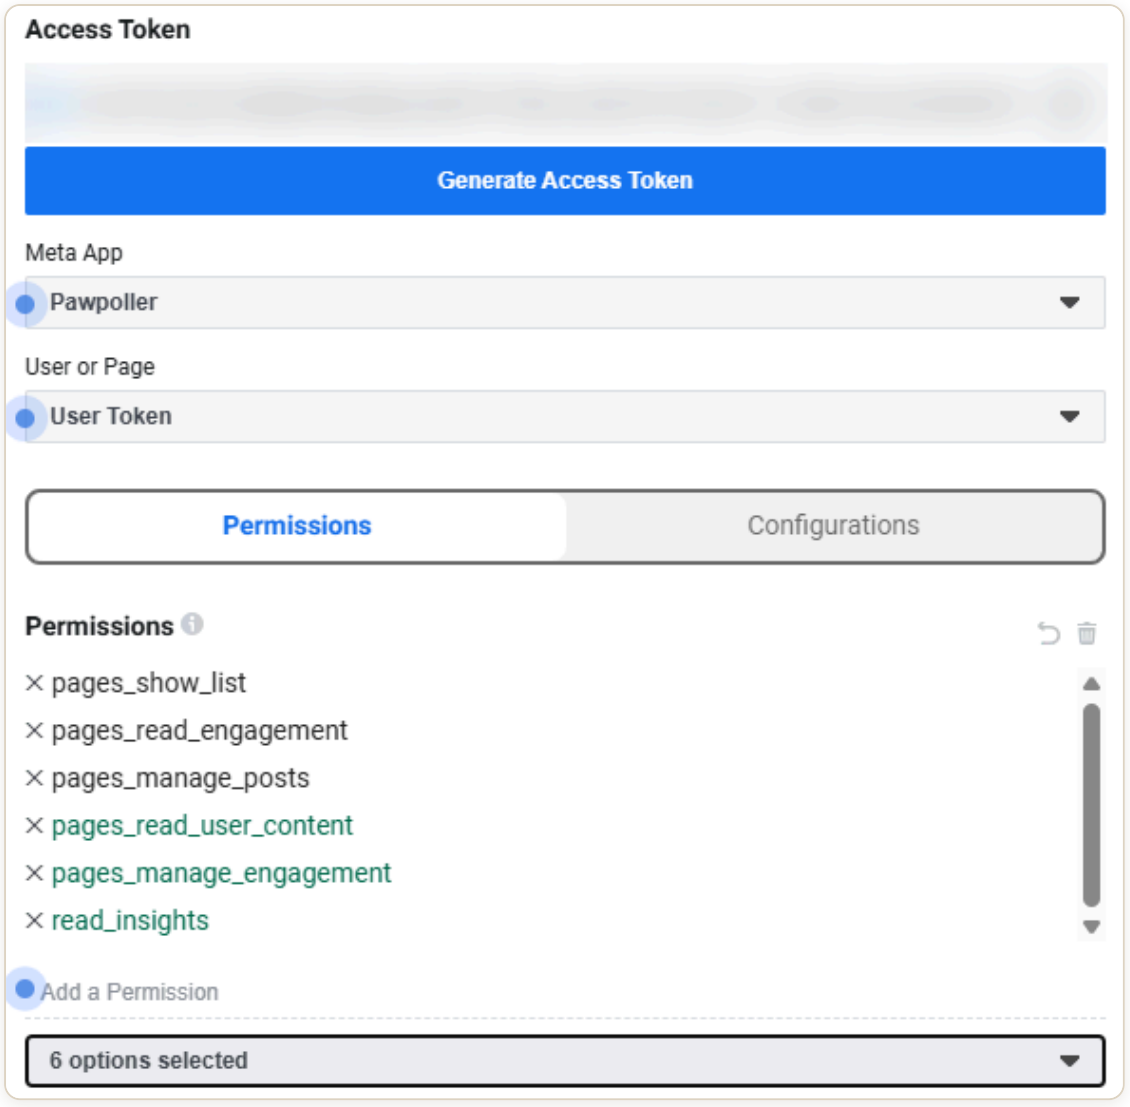

In the left menu open **App settings** → **Basic**. Copy the **App ID**. Next to **App secret** press **Show**; Facebook asks for your password, then shows it. Copy it too, and keep this tab open until you've connected.

App settings, Basic: the App ID box (blurred here) and the App secret box with its Show button

5 Open Graph API Explorer

This is Meta's page for making tokens. On the right, set **Meta App** to your app. Leave **User or Page** as it is: it makes a token for you, which is what PawPoller needs. Graph API Explorer ↗

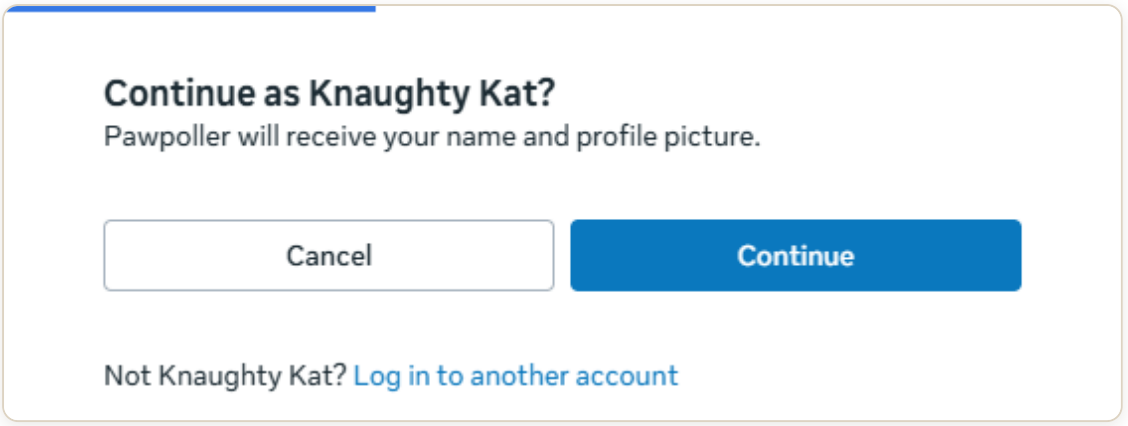

Graph API Explorer's right-hand panel: Meta App set to the app, and the permissions listed under Permissions

6 Choose the six permissions

Under **Permissions**, click **Add a Permission**, type `pages_show_list` and pick it from the list. Do the same for the other five: `pages_read_engagement`, `pages_manage_posts`, `read_insights`, `pages_read_user_content` and `pages_manage_engagement`. (`read_insights` sits further down the list, under **Other**: scroll down inside the list to find it.) You should see **6 options selected**. Only the permissions you added in step 3 appear; if one is missing, go back and add it there. (There is no separate video permission any more: `pages_manage_posts` covers videos.)

7 Make the token

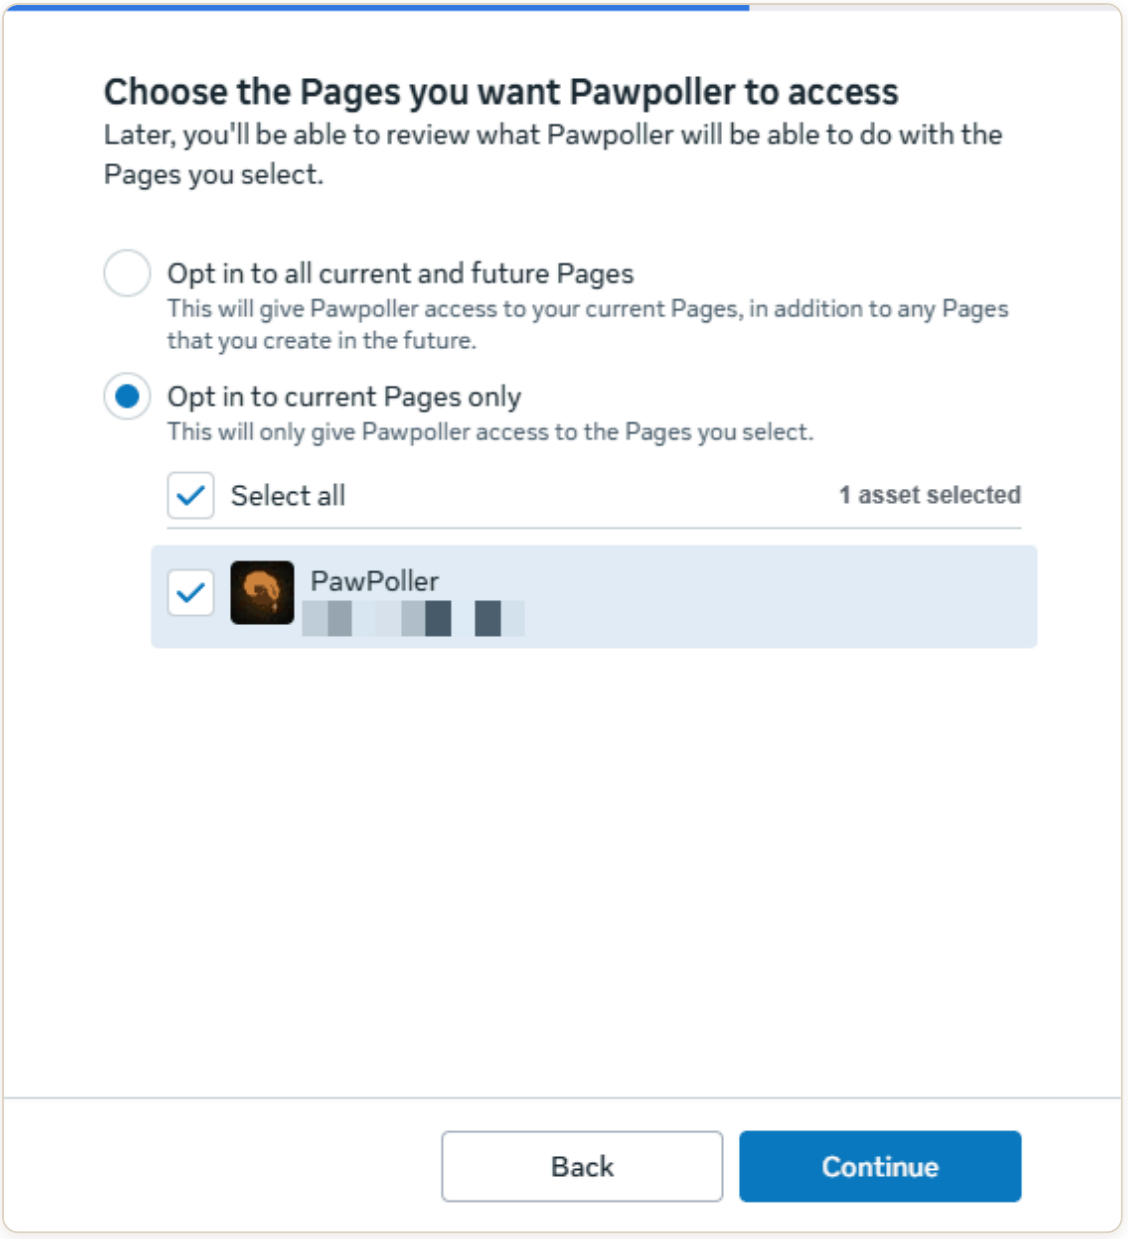

Press **Generate Access Token**. A Facebook window opens. If it says *Switching accounts*, press **Continue** (that happens when you were using Facebook as your Page). Press **Continue as** yourself.

Facebook's window: Continue as you? with Cancel and Continue

8 Choose your Page

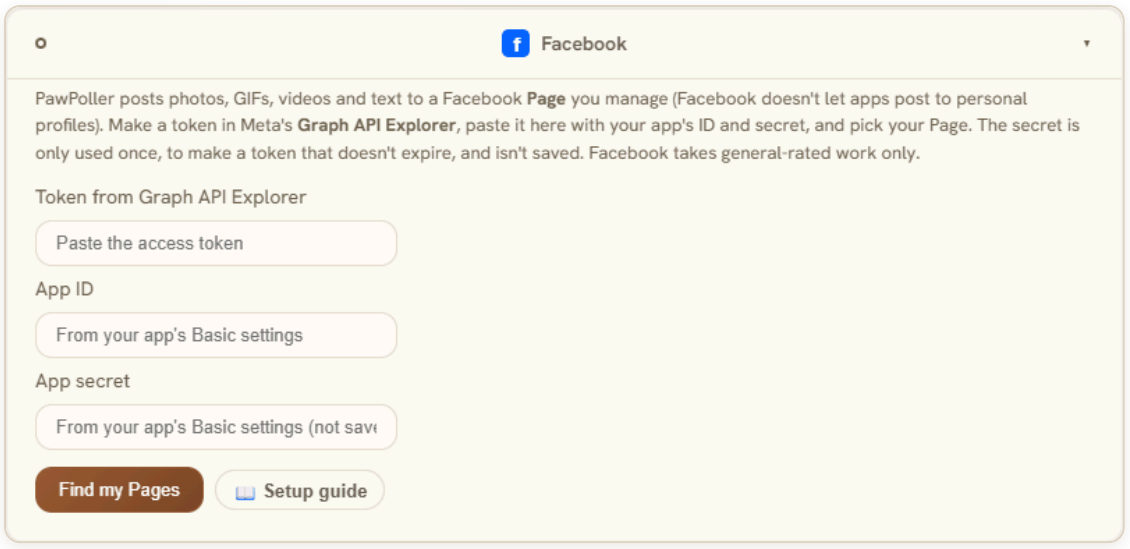

Choose **Opt in to current Pages only**, tick your Page, and press **Continue**. Facebook shows what the app will be allowed to do on that Page: press **Save**, then **Got it**. Back in the Explorer, the long token is now in the **Access Token** box. Copy it.

Choose the Pages: Opt in to current Pages only is selected and the Page is ticked (its number blurred here)

9 Connect in PawPoller

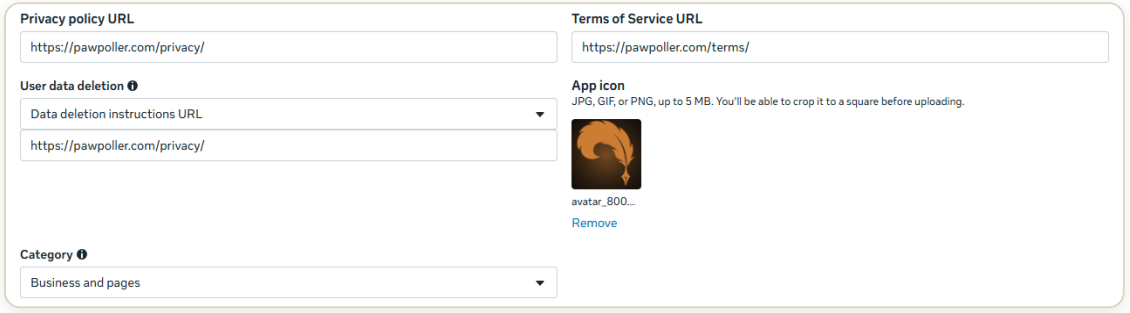

Go to **Settings** → **Platforms** → **Facebook**. Paste the token, the App ID and the App secret, and press **Find my Pages**. Pick your Page from the list and press **Connect**. You'll see **Connected — posting to** and your Page's name. (Connecting a second Page, or one for another persona? Add it from **Settings** → **Accounts** instead.)

PawPoller's Facebook card: Token from Graph API Explorer, App ID, App secret, and the Find my Pages button

10 Make your posts public

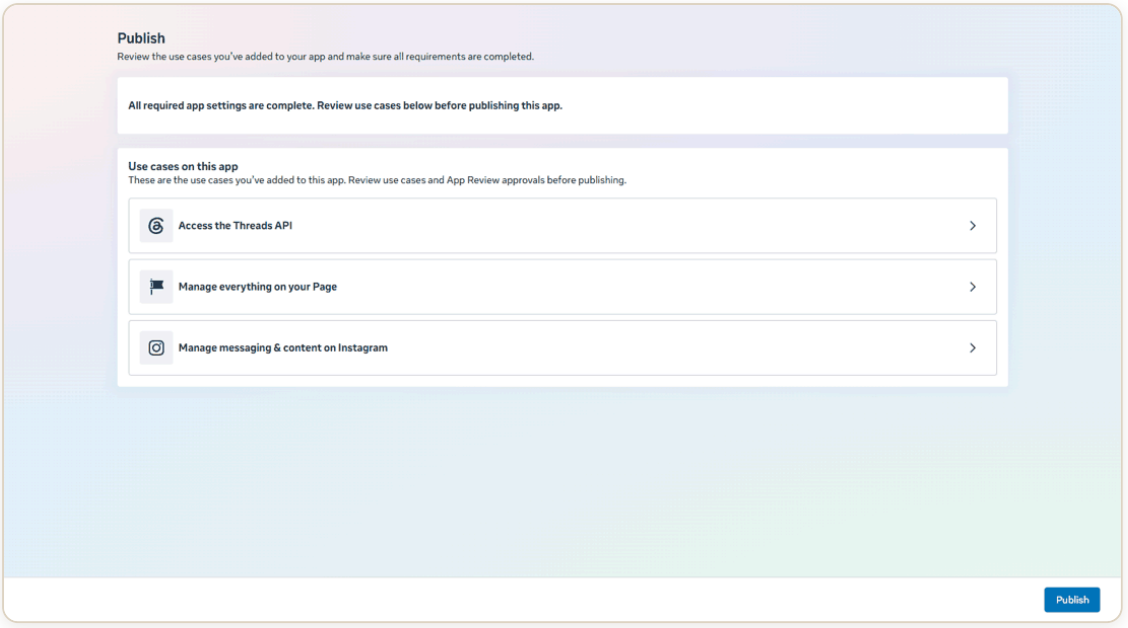

While your Meta app is in **Development mode**, only you can see what it posts: everyone else sees an empty Page. To fix that, open **App settings** → **Basic** and fill in **Privacy policy URL** and **User data deletion** (choose *Data deletion instructions URL*); `https://pawpoller.com/privacy/` works for both. Add a **Terms of Service URL** if you like (`https://pawpoller.com/terms/`), set **Category** to **Business and pages**, upload any square picture as the **App icon**, and press **Save changes**.

App settings, Basic: Privacy policy URL, Terms of Service URL, the data deletion URL, an app icon and the Business and pages category filled in

11 Publish the app

Go to the app's **Dashboard** and open *Check that all requirements are met, then publish your app* (or **Publish** in the left menu). When it says *All required app settings are complete*, press **Publish**. Facebook confirms *Your app was successfully published*, and everything you've posted becomes visible to everyone, the posts from before included.

The Publish page: All required app settings are complete, the app's use cases listed, and the Publish button

12 Check it works

On the **Accounts** list press **Test** next to the Facebook account. Then publish a piece and tick Facebook — it shows up on your Page within a few seconds. Open **Facebook** in the menu and press **Poll Now**: your posts appear with their views, reactions, comments and shares.

WHERE IT GOES IN PAWPOLLER

Settings → Platforms → Facebook → token + App ID + App secret, then Find my Pages and Connect

KEEPING IT ALIVE

The Page token doesn't expire. It only stops if you change your Facebook password, remove the app, or stop managing the Page. If that happens, make a new token in Graph API Explorer (steps 5–8) and connect again.

GOOD TO KNOW

- Do the Meta steps on a **desktop**, in **Edge or Firefox** — Chrome often breaks Meta's developer pages.
- Publishing the app (steps 10–11) only makes what *you* post public. It doesn't let anyone else use your app: other people could only post through it after Meta's App Review, which you don't need for your own Page.
- PawPoller keeps only the Page token. The App secret is used once, to swap the short token for one that doesn't expire, and is never saved.
- Facebook's rules don't allow sexual content or most nudity, so only **general**-rated work can go to Facebook. Mature and adult pieces are greyed out with the reason.
- Photos can be up to 10 MB (bigger ones are shrunk for you, and WebP is turned into JPEG). GIFs go up as short videos, so they keep moving. Videos can be up to 1 GB.
- Run more than one Page? Connect each as its own account and choose which one when you publish.

- PawPoller checks your Page every few hours: views, reactions (with the kinds — like, love and so on), comments and shares for every post, including ones you made on Facebook itself, plus your Page's followers. A number Facebook doesn't give shows as *not available*, not 0.
- New comments land in the **Inbox**. Press **Reply** there and your answer appears under the comment, posted as your Page.
- **Connected before 4.59?** Add `read_insights`, `pages_read_user_content` and `pages_manage_engagement` (step 3), make a new token with all six (steps 5–8) and connect again. Until then the Facebook dashboard says which permission is missing.
