PAWPOLLER · GETTING STARTED GUIDE

Itaku

Track an Itaku gallery; add an auth token to post to it.

Analytics + Posting | Easy Setup

Open this guide as a PDF ↗

WHAT YOU'LL NEED

- An Itaku username (for tracking)
- An auth token (only for posting) — from your logged-in session

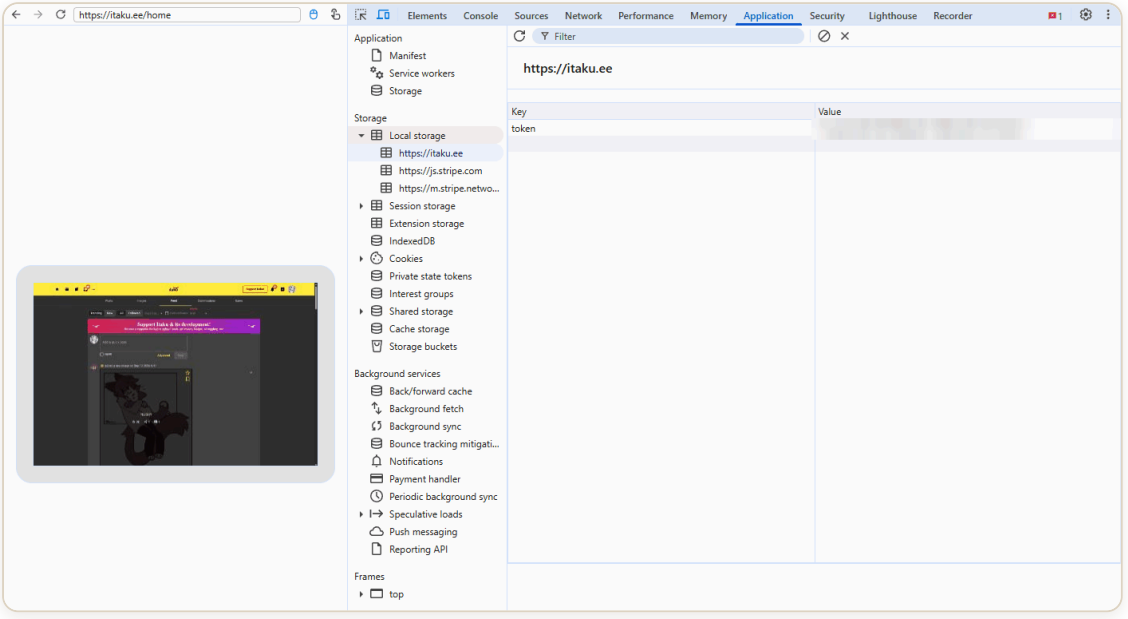

STEP BY STEP

1 Find the username

The Itaku account to track. Tracking needs nothing else — you can stop here. itaku.ee ↗

2 Grab your auth token — only if you want to POST

It is an API token, NOT a cookie (so it is not in the Cookies list). Log in at itaku.ee (**Log In**, top right), press **F12** → **Application** (Chrome/Edge) or **Storage** (Firefox) → **Local Storage** → `https://itaku.ee` and copy the value of the key named `token`. The same value also travels on every request as `Authorization: Token …` in the Network tab, if you prefer to read it there.

Itaku with DevTools open on Application → Local Storage → itaku.ee, the token key selected

3 Connect in PawPoller

Enter the username in Settings → Itaku. To also post, paste the token in the Auth token box and Save — the panel will then show "posting enabled".

WHERE IT GOES IN PAWPOLLER

Settings → Itaku → username (+ Auth token to post)

KEEPING IT ALIVE

If posting fails with "auth token not configured" or stops working. Grab a fresh token the same way (Network tab → the value after "Authorization: Token ") and Save it again.

GOOD TO KNOW

- Tracking works with just the username. The auth token is needed ONLY to post (and for full-res / private imports).
- The token is NOT a browser cookie — it is the value after "Token " in the Authorization request header, or the token in Local Storage.
