WHAT YOU'LL NEED

- A Mastodon account on any instance
- An access token with read + write scopes

STEP BY STEP

1 Open your instance's Development page

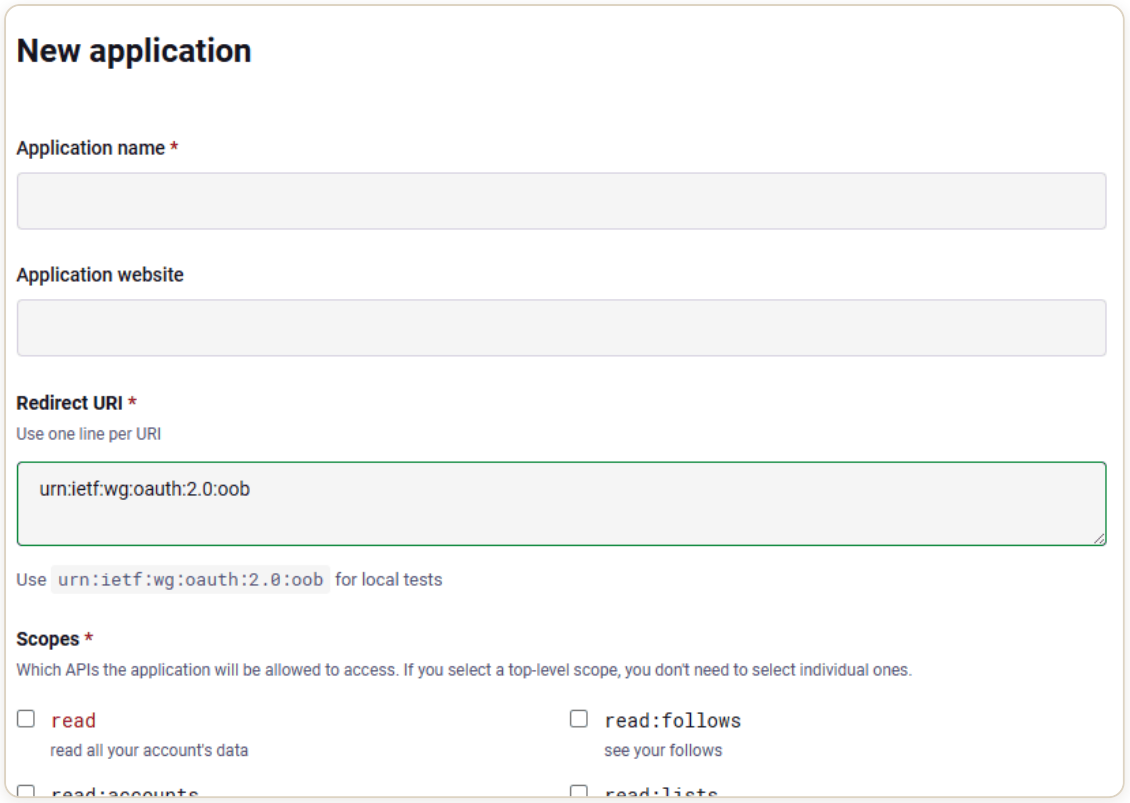

On your instance go to **Preferences** → **Development** → **New application**.

Preferences, the Development page: Your applications with the New application button

2 Create an application

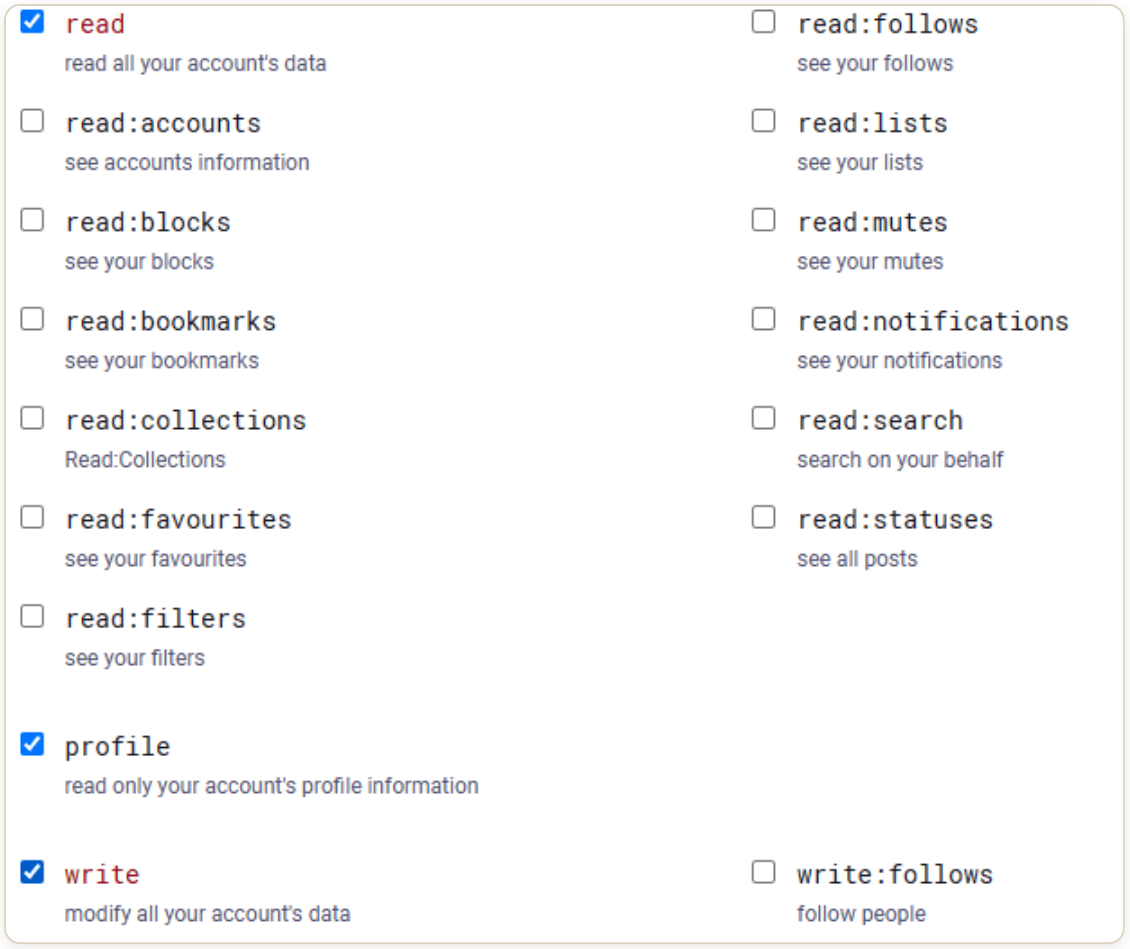

Name it "PawPoller" and leave the redirect URI as it is.

The New application form: Application name, Application website, Redirect URI

3 Tick the scopes

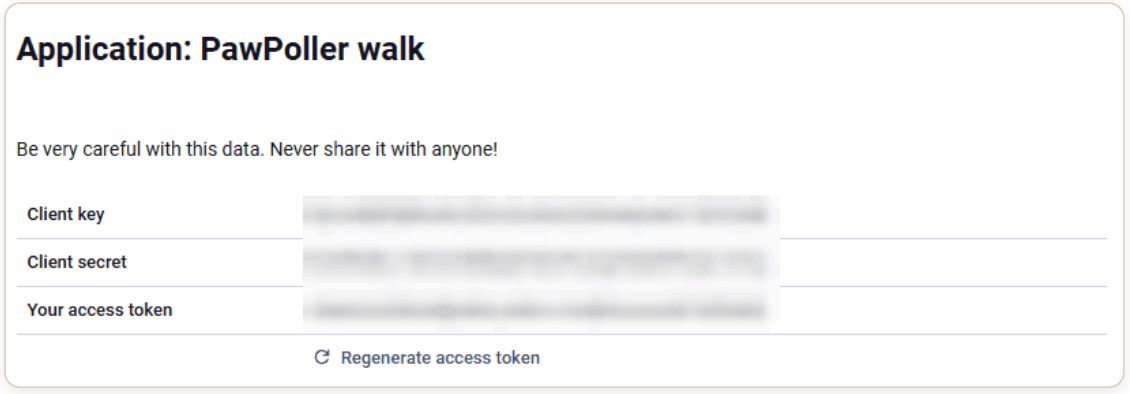

Tick the **read** scope (for polling) and **write** scope (for posting), then Submit.

The Scopes list with the top-level read and write boxes ticked

4 Copy the access token

Open the app you just created and copy **Your access token**.

The application page: Client key, Client secret and Your access token (all three blurred here)

5 Connect in PawPoller

Enter your instance URL (e.g. `https://mastodon.social`) and the access token in Settings.

WHERE IT GOES IN PAWPOLLER

Settings → Mastodon → Instance URL + Access token

KEEPING IT ALIVE

Tokens don't expire unless you delete the app. Re-create the application and paste the new token.

GOOD TO KNOW

- For **posting** the token must include the **write** scope — a read-only token polls fine but can't post.
