PAWPOLLER · GETTING STARTED GUIDE

Podcast feed

A podcast feed PawPoller serves itself — publish audio pieces to it and they appear on Spotify, Apple Podcasts and everywhere else.

Posting | Medium Setup

WHAT YOU'LL NEED

- A server install with a public address
- An email address for the feed's owner line

STEP BY STEP

1. **Give the server a public address**

   Podcast directories fetch the feed from the internet, so the server needs `IG_PUBLIC_BASE_URL` set — the same setting the Instagram host uses. The Podcasts page says so until it is.

2. **Make a feed**

   Open **Podcasts** (under Your works), click **New feed** and fill in the title, address, author, owner email, category and whether it is explicit.

3. **Publish an episode**

   Publish any audio piece from the Library and pick the feed as a target, the way you would a Telegram channel. The piece's poster becomes the episode art and an adult-rated piece is marked explicit.

4. **Submit the feed once**

   Copy the feed address (`/feed/<slug>.xml`) into Apple Podcasts Connect, Spotify for Creators, Amazon Music and Pocket Casts. From then on every episode you publish appears there on its own. Spotify for Creators ↗

WHERE IT GOES IN PAWPOLLER

Podcasts page → New feed (no credentials — PawPoller is the host)

KEEPING IT ALIVE

Nothing expires. The audio streams from your own Library; keep the server's public address stable, since the directories cache it.

GOOD TO KNOW

- Nothing is uploaded anywhere: the directories read your feed and the audio streams from the server.

- The owner email goes in the feed's owner tag, which directories use to verify ownership — it is never shown in PawPoller's logs.
- Feed art falls back to the newest episode's poster when the feed has none of its own.
