PAWPOLLER · GETTING STARTED GUIDE

Telegram

Broadcast art and story announcements to a Telegram channel you run, and track the reactions and subscribers they earn.

Analytics + Posting | Easy Setup

Open this guide as a PDF ↗

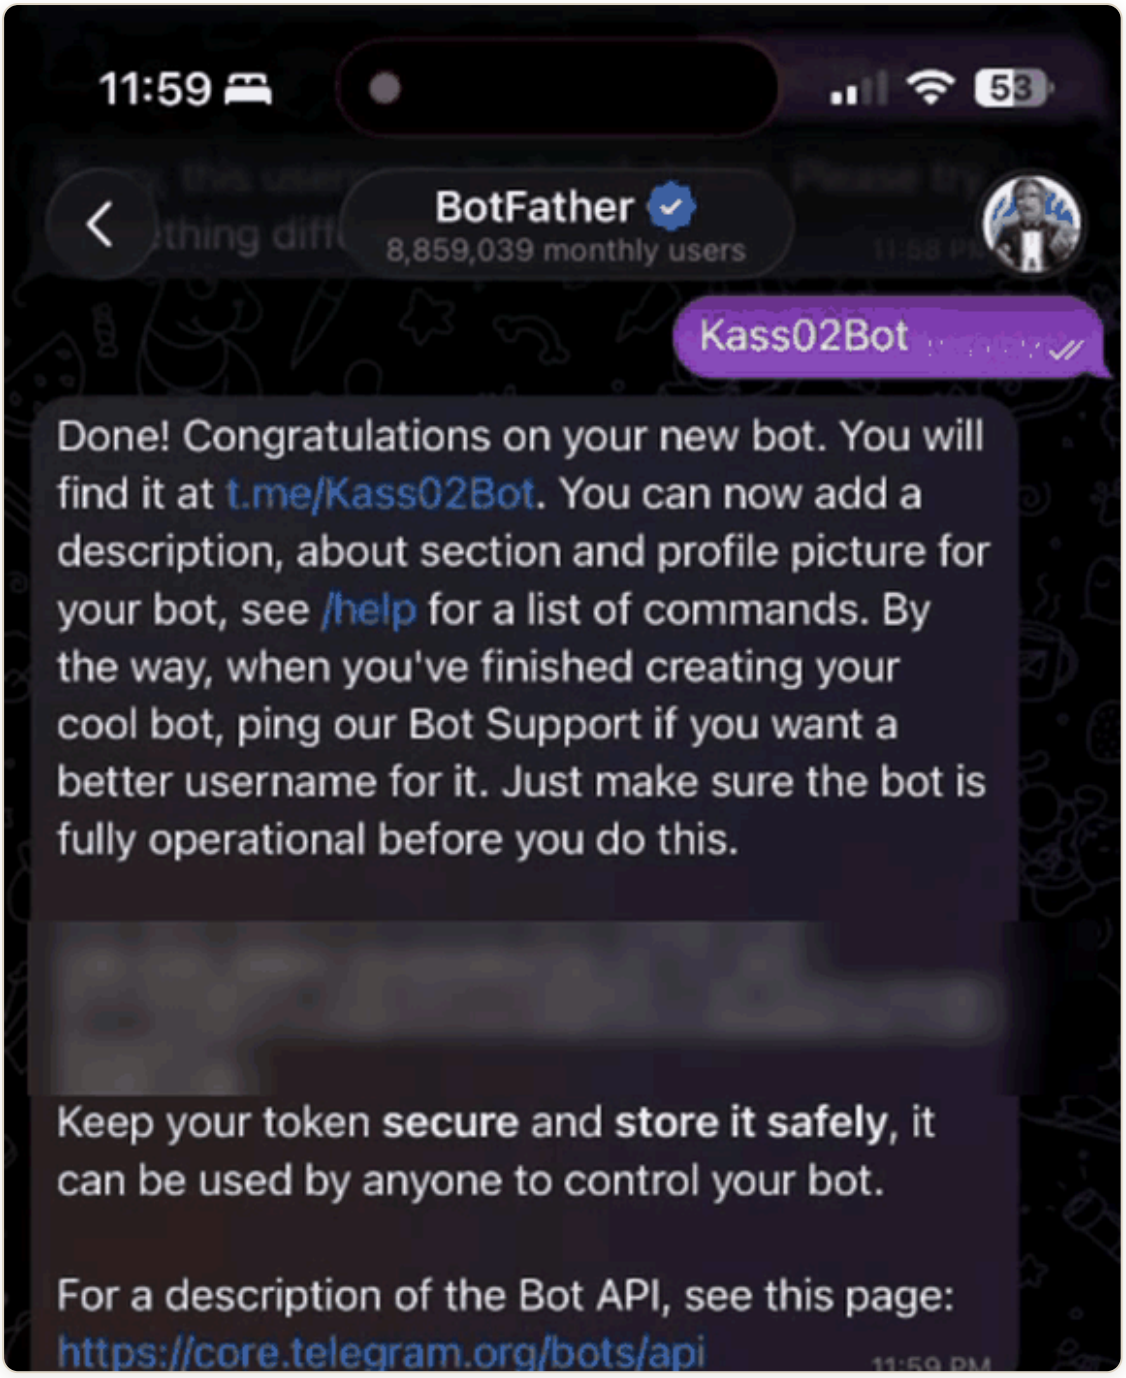

WHAT YOU'LL NEED

- A Telegram channel you own
- A bot made just for the channel (30 seconds in @BotFather) — not your notification bot
- The bot added to the channel as an admin

STEP BY STEP

1 Create a bot

Message **@BotFather** on Telegram and send `/newbot`. Give it a name and a username ending in `bot`. He replies with a **token** — a long string like `123456789:AAHk…`. That whole string is the token. @BotFather ↗

BotFather replying Done with the new bot username and the HTTP API token, the token blurred

---

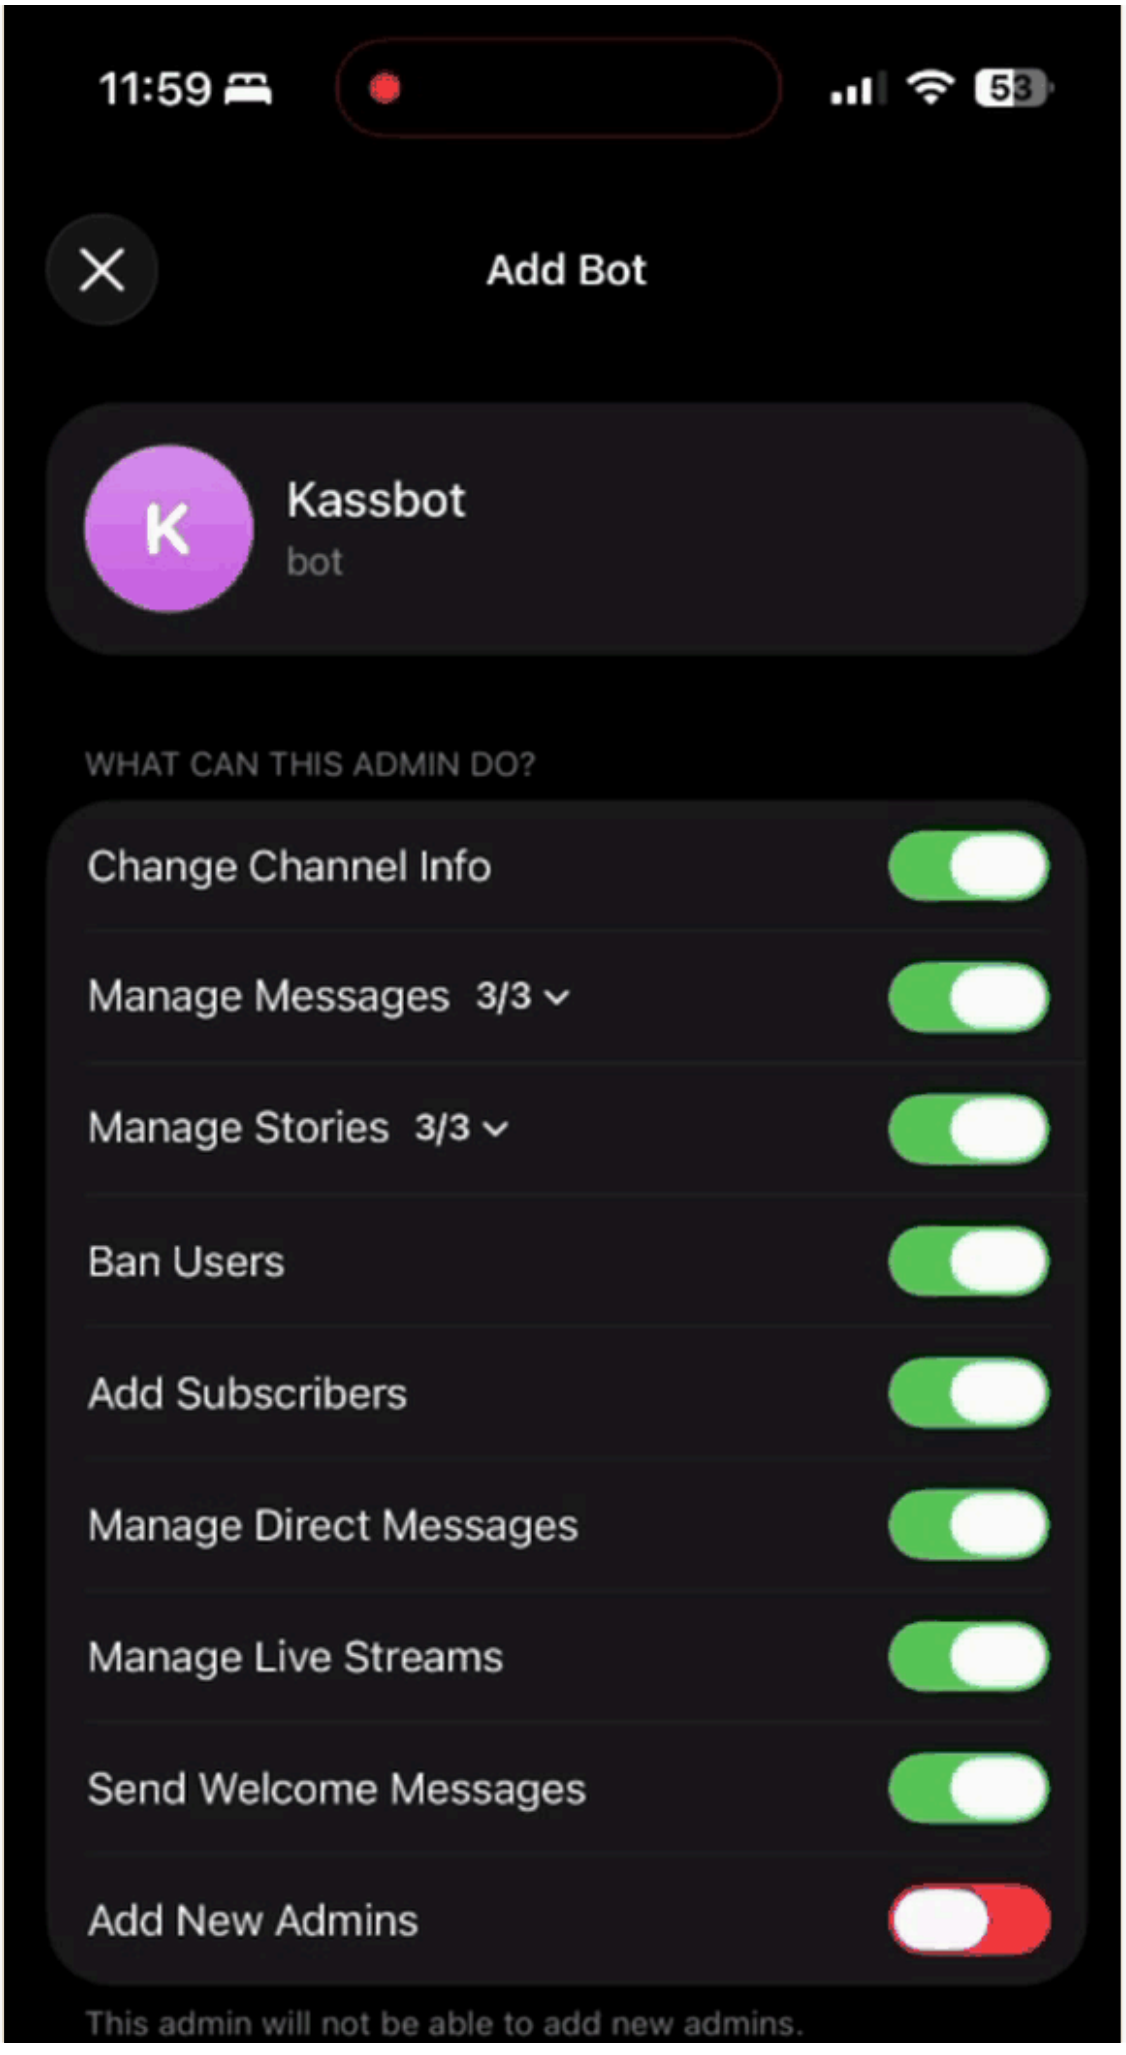

2 Create your channel

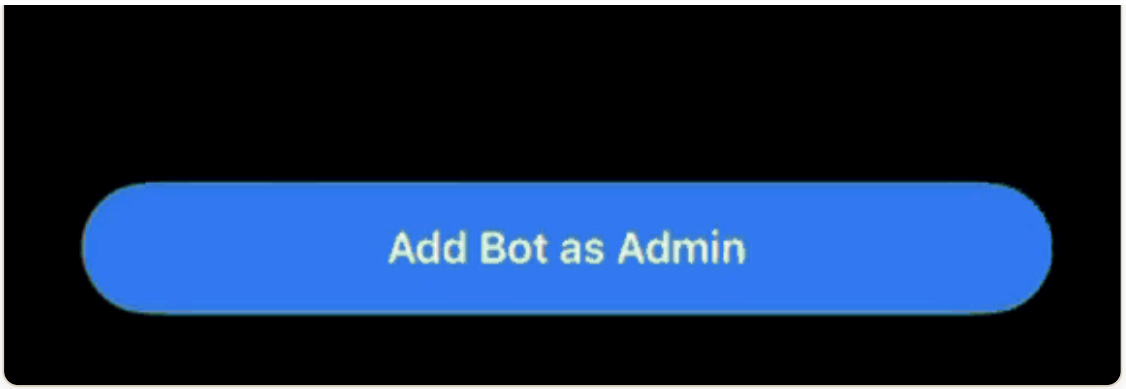

In Telegram: **New Channel**. Public or private both work — a public channel gets a `@username`, a private one does not.

---

3 Add the bot as an admin

Channel → **Administrators** → **Add Admin** → your bot. ⚠ **Tick "Post Messages"** — admin rights are individual toggles, and a bot can be an admin and still not be allowed to post. This is the step people miss.

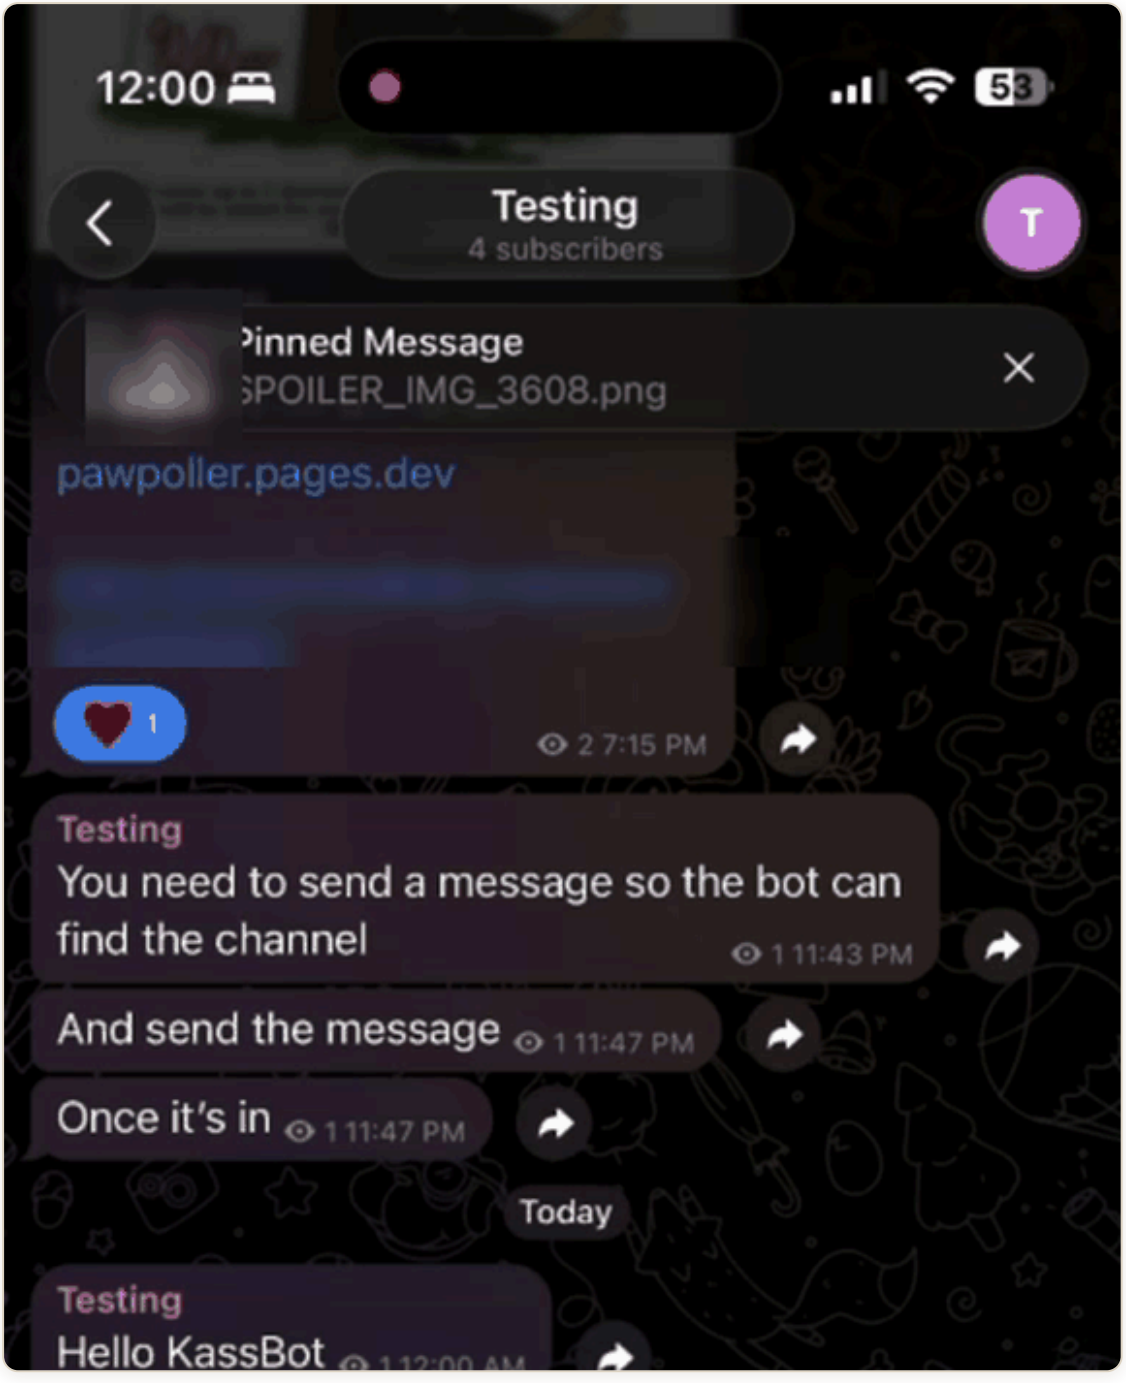

11:59
Add Bot
Kassbot
bot
WHAT CAN THIS ADMIN DO?
Change Channel Info
Manage Messages 3/3
Manage Stories 3/3
Ban Users
Add Subscribers
Manage Direct Messages
Manage Live Streams
Send Welcome Messages
Add New Admins
This admin will not be able to add new admins.

Telegram's Add Bot sheet for a channel: the admin rights toggles with Manage Messages on and Add Bot as Admin at the bottom

4 **Post one message in the channel**

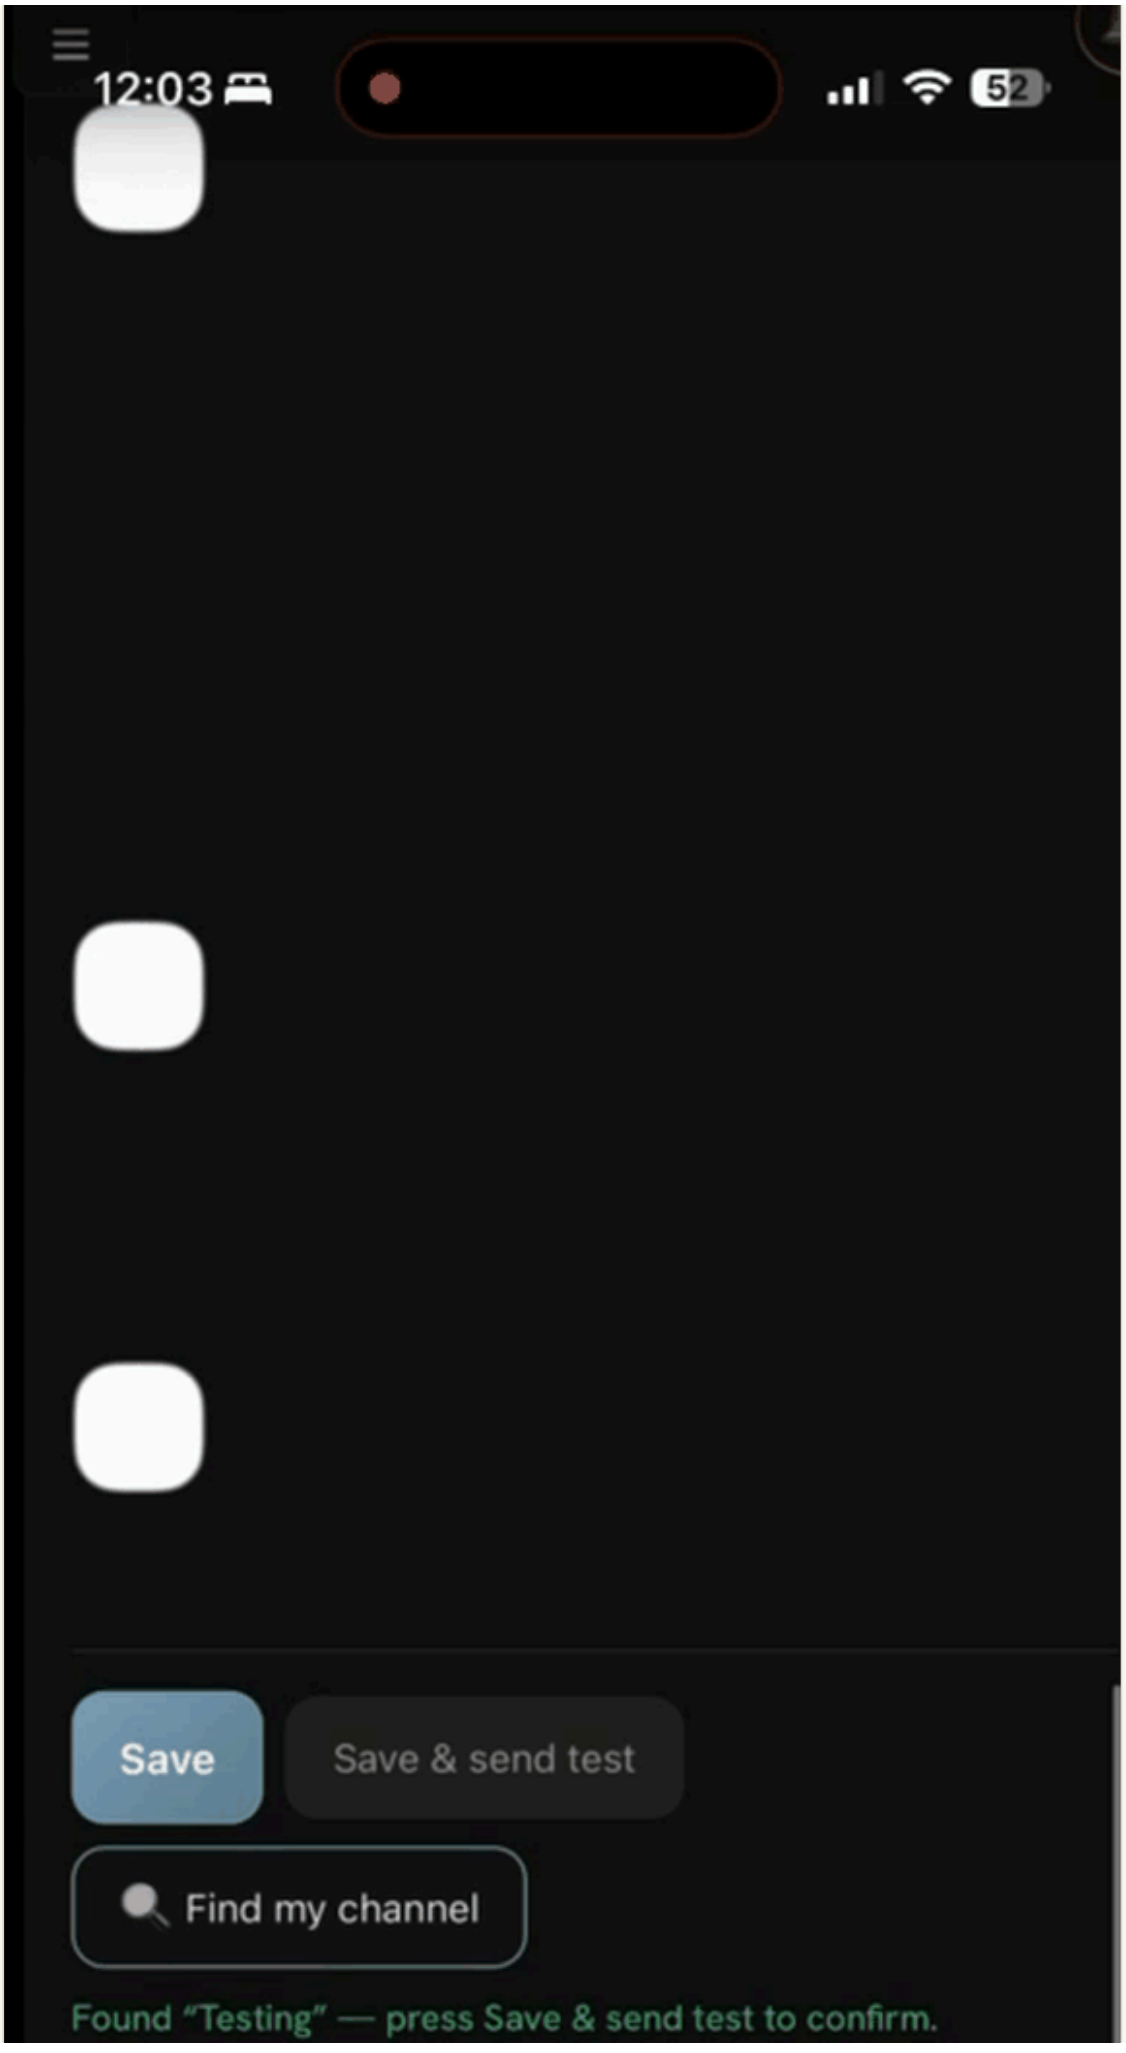

Anything at all. An admin bot receives channel posts, which is how PawPoller can find the channel's id for you.

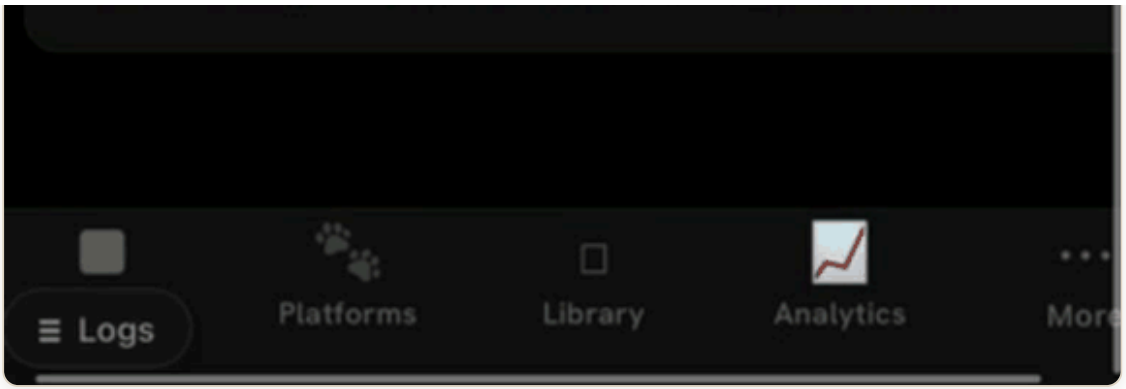

The channel after the bot was added, with a plain Hello message typed so the bot can see the channel

5 Connect in PawPoller

Settings → Telegram → paste the bot token, then press 🔍 **Find my channel**. It fills the channel in. Then **Save & send test** — a real message lands in the channel, and PawPoller tells you *which* channel it reached.

Find my channel
Found "Testing" — press Save & send test to confirm.

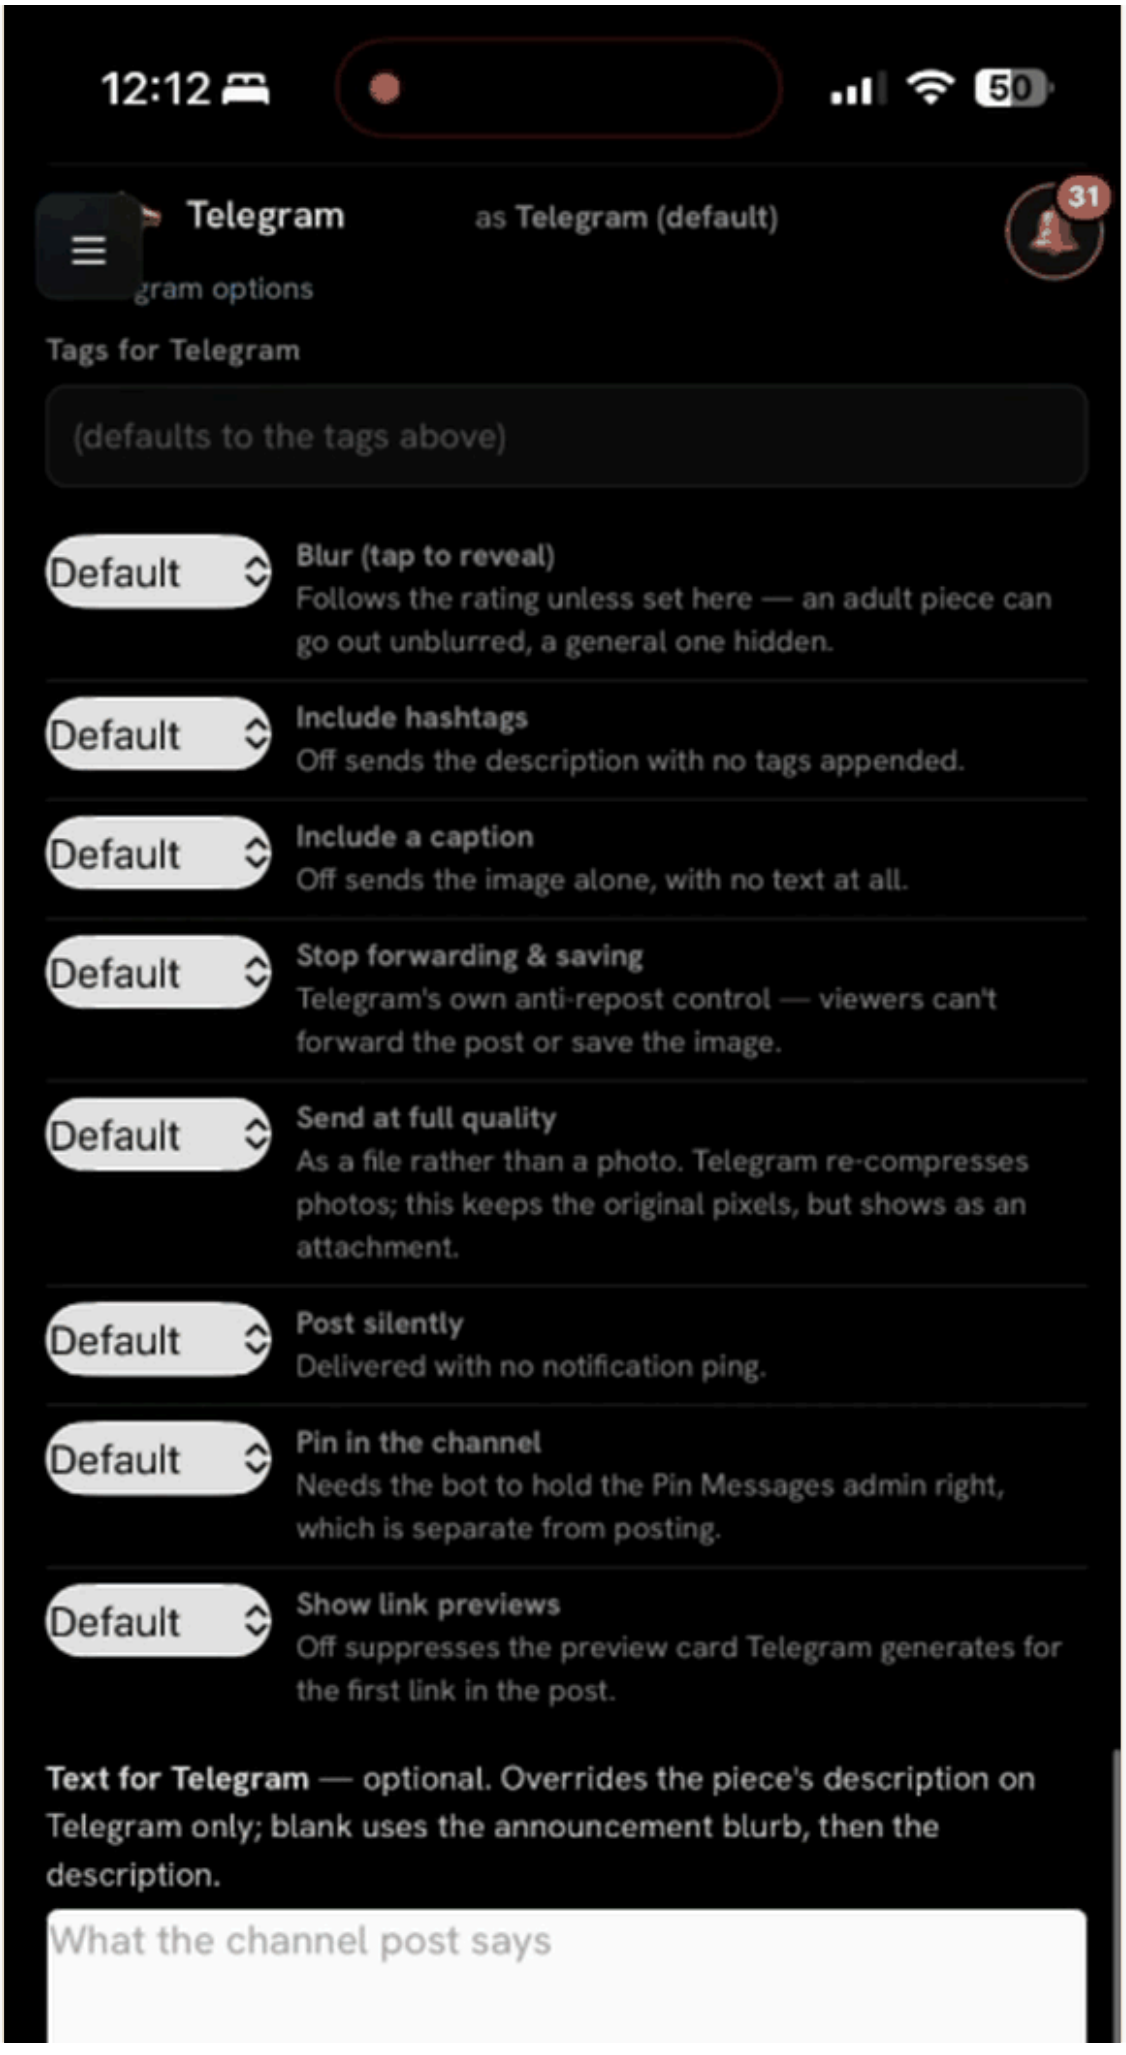

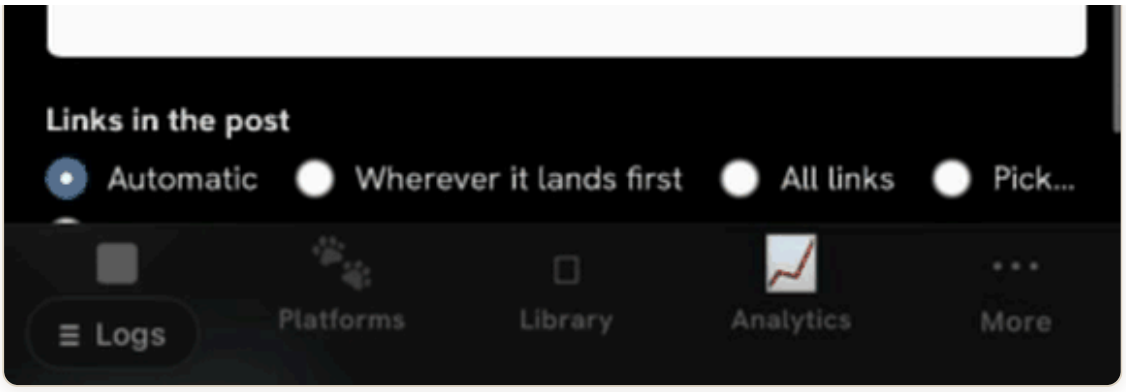

PawPoller Settings, Telegram channel posting: Find my channel has found the channel and asks for Save and send test

6

Publish a piece to it

Open any artwork or story in the Library, choose Telegram in **Publish to more**, and set the per-post options — blur, hashtags, caption, silent, pin — or leave the channel defaults. **Publish now** sends it; the post appears in the channel within seconds.

12:12
Telegram
as Telegram (default)
31
gram options
Tags for Telegram
(defaults to the tags above)
Default
Blur (tap to reveal)
Follows the rating unless set here — an adult piece can go out unblurred, a general one hidden.
Default
Include hashtags
Off sends the description with no tags appended.
Default
Include a caption
Off sends the image alone, with no text at all.
Default
Stop forwarding & saving
Telegram's own anti-repost control — viewers can't forward the post or save the image.
Default
Send at full quality
As a file rather than a photo. Telegram re-compresses photos; this keeps the original pixels, but shows as an attachment.
Default
Post silently
Delivered with no notification ping.
Default
Pin in the channel
Needs the bot to hold the Pin Messages admin right, which is separate from posting.
Default
Show link previews
Off suppresses the preview card Telegram generates for the first link in the post.
Text for Telegram — optional. Overrides the piece's description on Telegram only; blank uses the announcement blurb, then the description.

WHERE IT GOES IN PAWPOLLER

Settings → Telegram → Channel posting

KEEPING IT ALIVE

Bot tokens don't expire. Only if you revoke one with /revoke in BotFather — then paste the new token back in.

GOOD TO KNOW

- **Two bots, always.** If you also use PawPoller's Telegram notifications, that is a different bot: PawPoller refuses to let one token do both jobs, because a bot that is an admin of a channel can be mistaken for your private chat — and a digest once went public that way.
- ⚠ **A private channel has no `@username`.** Its title is not a handle. It can only be reached by a numeric `-100…` id, which Telegram never shows you — that is what **Find my channel** fetches. A `t.me/+…` invite link is not a handle either, and a bot cannot join by invite link at all.
- ⚠ **Typing a bare name is risky.** A bare word is treated as a public `@username`, and someone else may already own it. PawPoller now tells you which channel it actually reached, so check that name is yours.
- **Reactions are counted from the day you switch tracking on.** Telegram *pushes* reactions and offers no way to ask for them, so anything posted before then shows as *not counted* rather than as zero — a real absence of measurement, not an absence of interest.
- **No view counts, ever.** The eye-count you see on a channel post is not in the bot API at all. It is not a gap PawPoller can close later.
- **Posts are never edited.** Telegram's API refuses to edit anything older than 48 hours, so PawPoller leaves a Telegram post alone and skips it when syncing corrections elsewhere.
- **Stories are announced, not posted.** A Telegram message caps at ~700 words, so a story goes out as a cover, a blurb, and links to where it is actually published.
- **Full control per piece.** Blur, hashtags, caption, forwarding, full quality, silent and pin can be set channel-wide in Settings and overridden on any single artwork or story.
