PAWPOLLER · GETTING STARTED GUIDE

Threads

Track views/likes/reposts/replies on your Threads posts, and post words, pictures, GIFs and video.

Analytics + Posting | Involved Setup

Open this guide as a PDF ↗

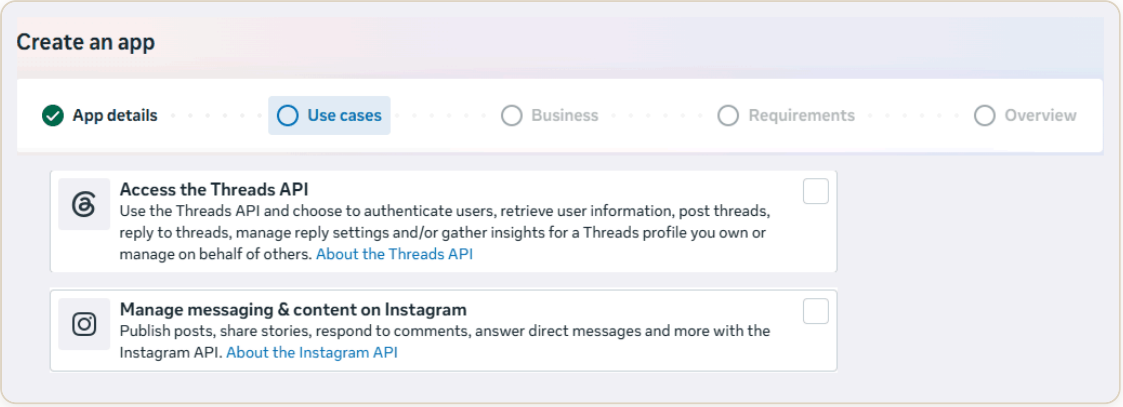

WHAT YOU'LL NEED

- A Threads account (public)
- A free Meta developer app — the same one Instagram uses, if you have that too
- A long-lived access token

STEP BY STEP

1 Create (or open) a Meta developer app

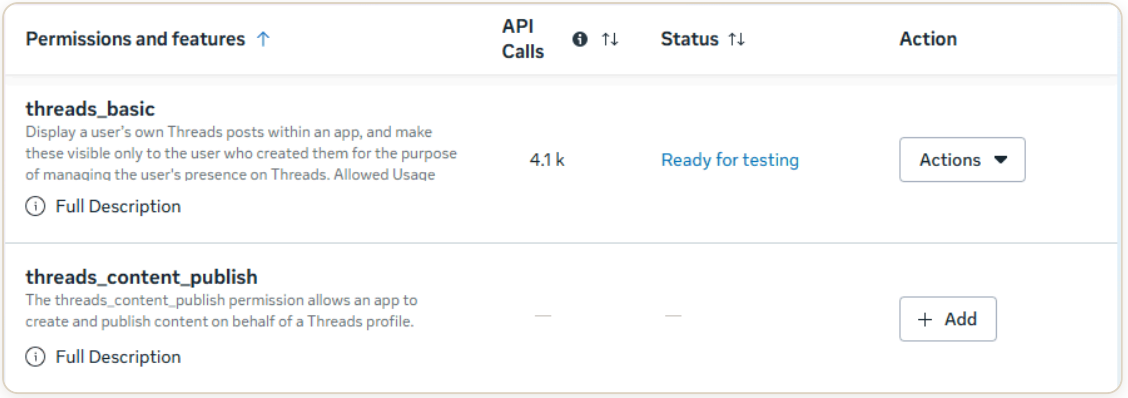

On **My Apps** press **Create app**. Name it anything, and on the **Use cases** step tick **Access the Threads API** (tick *Manage messaging & content on Instagram* at the same time if you want Instagram). No business portfolio is needed; finish the wizard. Already have the app? Open it and use **Add use cases**. developers.facebook.com/apps ↗

Create an app: the Use cases step, with Access the Threads API and Manage messaging & content on Instagram

2 Open the Threads use case

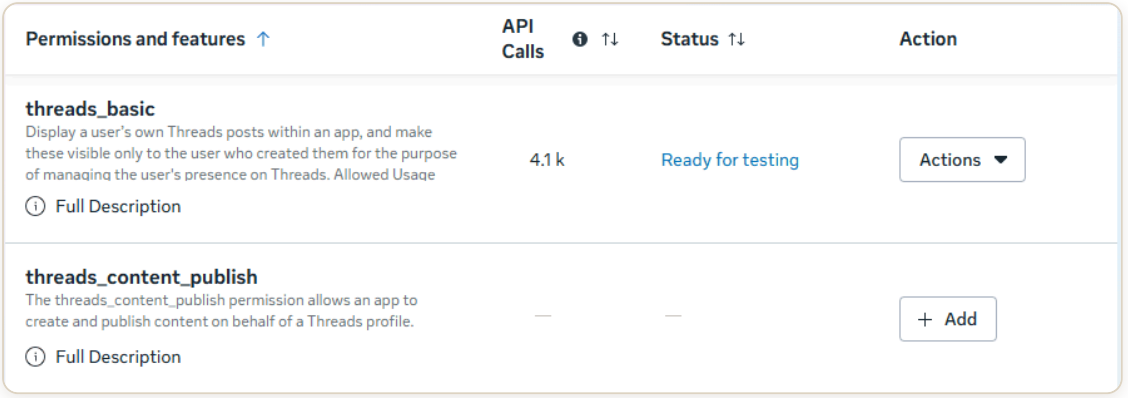

Dashboard → **Use cases** → **Customize** next to *Access the Threads API*. `threads_basic` is already in the permissions table. Adding `threads_manage_insights` is optional: on the app this guide was written from it was never added and the stats still arrive — that table is about App Review, not your own tester token. If you want a comment under your posts (4.56.0), also press **Add** next to `threads_manage_replies`.

The Threads use case permissions table: threads_basic Ready for testing, the rest with an Add button

3 Add the posting permission

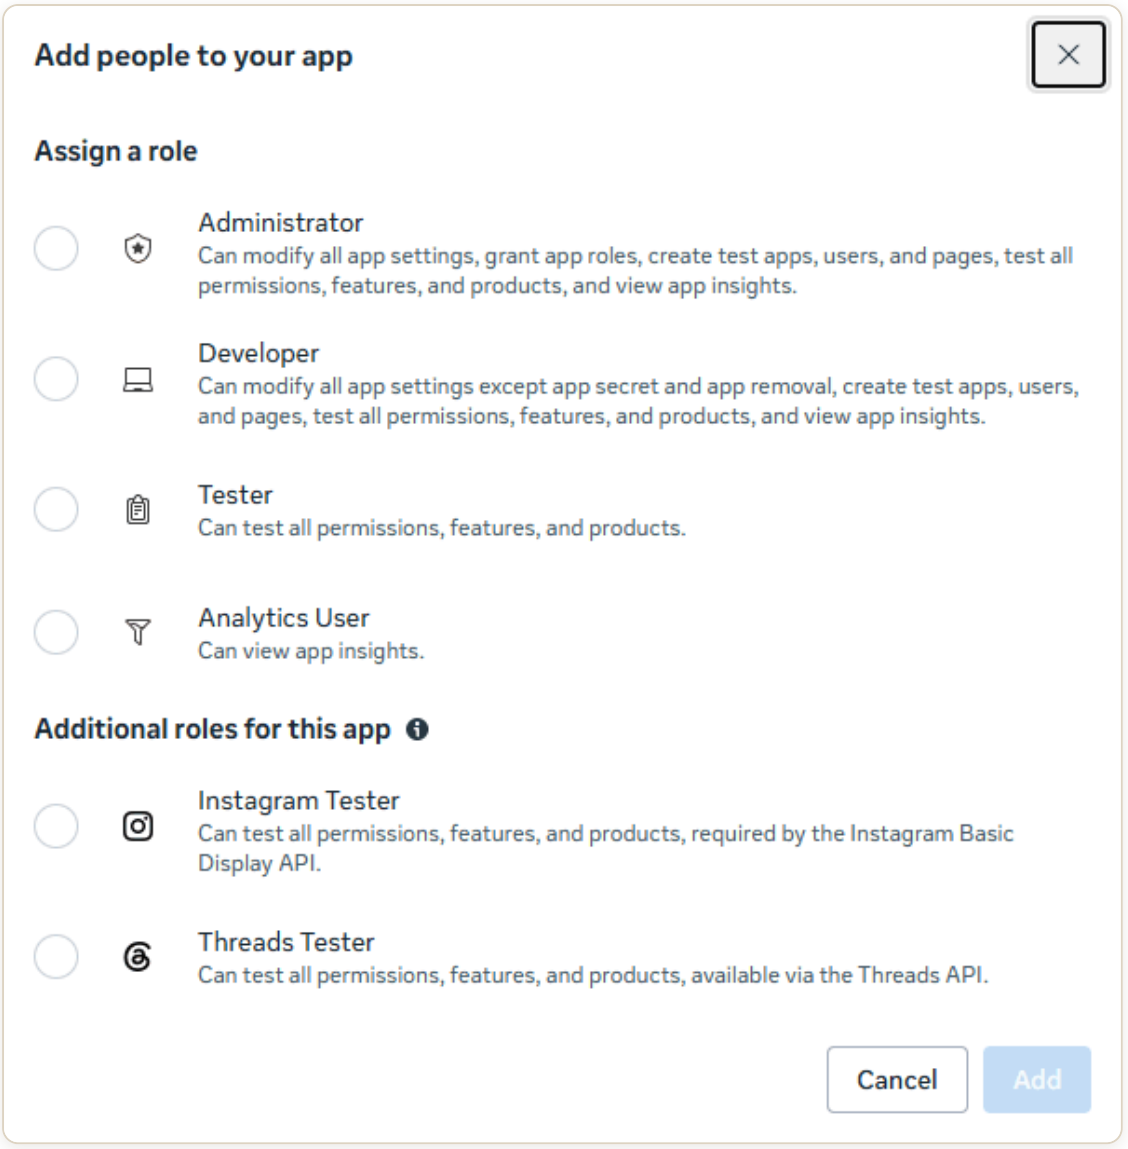

To post from PawPoller, press **Add** next to `threads_content_publish` in the same table. Without it, Threads refuses every post and PawPoller says this permission is missing. Already connected? Make a new token afterwards (the step below) and paste it in again: an old token does not gain the permission.

The Threads use case permissions table: threads_basic Ready for testing, the rest with an Add button

4 Add yourself as a Threads Tester

On the use case's **Settings** tab press **Add or Remove Threads Testers** (it is the same page as **App roles** → **Roles**). **Add People** → pick **Threads Tester** under *Additional roles* → type your Threads username.

Add people to your app: Instagram Tester and Threads Tester under Additional roles

---

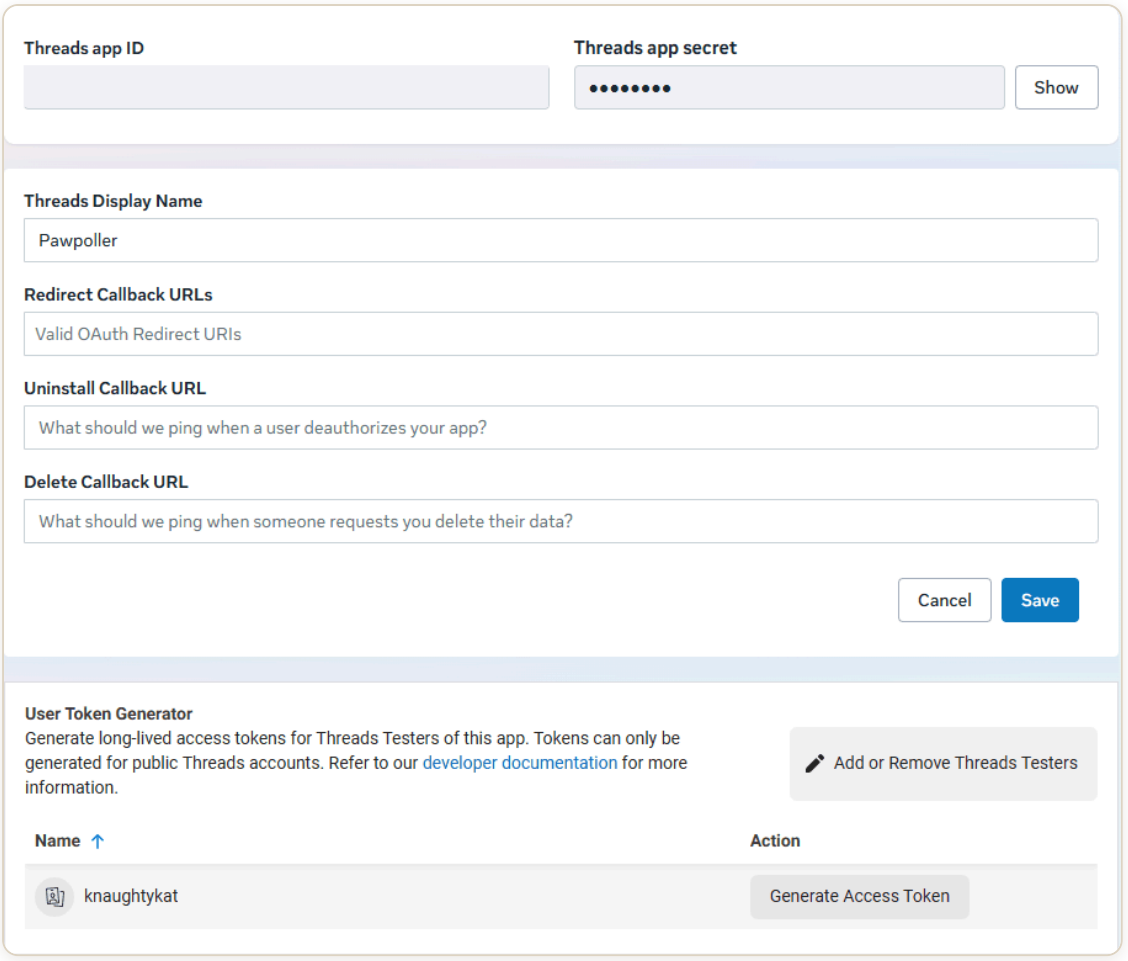

5 Accept the invite inside Threads

In the Threads app or on threads.net: **Settings** → **Account** → **Website permissions** → accept the tester invite. Until you do, the token generator will not list you.

---

6 Generate the long-lived token

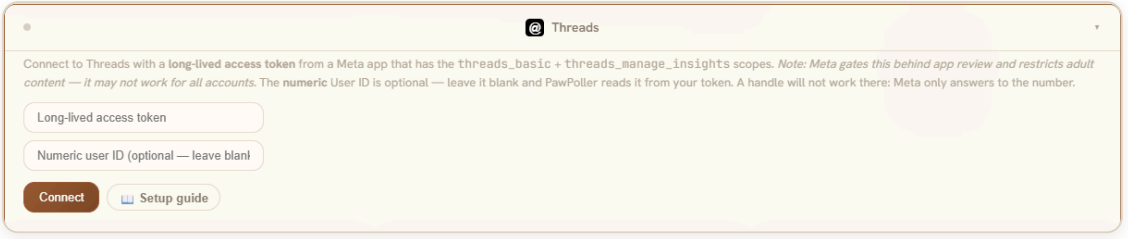

Back on the use case's **Settings** tab, under **User Token Generator** your username now has a **Generate Access Token** button. Approve what it asks for, then copy the whole token — it is several hundred characters.

Threads use case Settings tab: display name, empty callback URLs, and the User Token Generator with a Generate Access Token button

7 Connect in PawPoller

Settings → Platforms → Threads: paste the token, leave the user ID blank, press **Connect**. PawPoller reads your username back from the token — check it is the account you meant.

PawPoller Settings, Threads card: access token, optional user id, Connect

WHERE IT GOES IN PAWPOLLER

Settings → Threads → Access token (user id optional — leave blank)

KEEPING IT ALIVE

Long-lived tokens last ~60 days. PawPoller auto-refreshes the token while it's polling. If it goes unused past ~60 days and lapses, generate a fresh one on the same Settings tab and paste it in — the app, tester role and use case all stay valid.

GOOD TO KNOW

- Do the whole setup on a **desktop** (not mobile) in **Microsoft Edge — or any browser that is NOT Chrome**. Chrome reliably breaks Meta's developer dashboard and token generator: the flow silently fails or the token never appears. Edge/Firefox work.
- Leave the app **Unpublished**. Development mode with your own account needs no App Review, and the Publish button stays greyed out until you add a privacy policy — you do not need one.
- Meta adds **Facebook Login for Business** and a **Manage everything on your Page** use case by itself. PawPoller never uses either; ignore them.
- Meta gates the API behind App Review for public use and removes adult content — for your own account in Development mode it works without review.
