PAWPOLLER · GETTING STARTED GUIDE

Trello

Your Trello boards inside PawPoller — drag cards here or on your phone, and both stay in step.

Commissions Board | Medium Setup

Open this guide as a PDF ↗

WHAT YOU'LL NEED

- A free Trello account
- A board for your commissions (a new, empty one is fine)

STEP BY STEP

1 Make a board for your commissions

In Trello, make a board with a column for each stage you use. PawPoller has five: **Quote**, **Accepted**, **In progress**, **Paid** and **Delivered**. Name the columns whatever you like — you will match them up later, and renaming one afterwards changes nothing. trello.com ↗

2 Open Trello's developer page

Go to **trello.com/power-ups/admin** and sign in. This is where Trello hands out API keys. It looks like a page for app developers, and it is — but it is also the only way to get a key, so everyone has to come through here.
trello.com/power-ups/admin ↗

3 Start a new app

Click **New**. Trello calls this an "app" or a "Power-Up" — it is the thing Trello issues an API key to, and you have to have one before it will give you a key.

4 Pick "My app doesn't use Power-up capabilities"

This is the whole trick, and it is the **first thing on the form**, above the name box.

Two radio buttons: **My app will use Power-up capabilities** (selected for you) and **My app doesn't use Power-up capabilities**. Choose the **second** one. The **Iframe connector URL** box disappears the moment you do — it only exists for apps that add buttons and panels inside Trello itself, which PawPoller does not. That is why you cannot leave it blank: with the first option chosen, Trello will not let you save without a URL you have no reason to own.

⚠ Trello says this **cannot be changed after the app is created**, so pick it now. If you have already made an app the other way, see the last note at the bottom of this guide — it still works.

5 Fill in the rest and create it

What is left is short:

- **App name** — anything. "PawPoller" is fine; you can change it later.
- **Workspace** — the one your board is in.
- **Email** and **Support contact** — yours.
- **Author** — your name.

Press **Create**.

---

6 Generate the API key

You land on your app's settings. In the list down the left, click **Authorization**, then **Trello Auth** underneath it. Press **Generate a new Trello Auth API key for this app**.

Trello suggests OAuth 2.0 on the same page. Ignore it: that is for apps other people install, and it needs a web address to send them back to. You are setting up your own copy.

---

7 Three boxes appear — here is what each one is

⚠ This page shows **three** long strings and it is easy to mix them up.

- **API key** — the first one. Copy it; it goes in PawPoller's **API key** box.
- **Allowed origins** — leave empty. It only controls where Trello may redirect after an authorisation, and nothing here redirects anywhere.
- **Secret** — the third one. You only need it for **live updates** (step 12). Trello offers no way to reset it, so treat it like a password you cannot change: paste it into PawPoller and nowhere else.

---

8 Get the token

Under the API key there is a sentence ending in a **Token** link — click it. Trello asks whether to let your app use your account; press **Allow**. The next page shows one more long string: that is your **token**. Copy it.

If you would rather not hunt for that link, paste the API key into **Settings** → **Trello** first and press **Get my token** — PawPoller opens the same page for you, and asks for slightly fewer permissions while it is there (it does not need access to your profile).

You do not need a callback URL, whichever way you go. The link asks Trello to simply show you the token rather than send it somewhere, so there is nothing to redirect to and nothing to put in **Allowed origins**. It also asks for a token that **never expires** — one with an expiry date would stop the sync on that day with no warning.

---

9 Paste both into PawPoller

In **Settings** → **Trello**: the **API key** in the first box, the **token** in the second.

---

10 Check it worked

With both boxes filled, press **Test**. It should answer with your Trello username. If it does not, the two values have most likely ended up in the wrong boxes — the key is the one you generated, the token is the one Trello showed you after you pressed Allow.

---

11 Save

Press **Save**. Your boards start arriving by themselves — open **Boards** in the menu to watch them come in.

12 Optional: copy the Secret, for live updates

Go back to Trello's API key page from step 7. The **third** long string, labelled **Secret**, is the one you want. Click **Show** next to it if it is hidden, then copy it.

You only need this if PawPoller runs on a **server**. It lets Trello tell PawPoller about a change within seconds. The desktop app cannot be reached by Trello, so it checks every minute or so instead, and does not need the Secret.

13 Paste the Secret into PawPoller

In **Settings** → **Trello**, paste it into the **Secret** box and press **Save**. Keep it private — do not paste it anywhere else, because Trello offers no way to reset it.

14 Turn on live updates

Still in **Settings** → **Trello**, press **Turn on live updates**. PawPoller says how many boards it is now watching. If it says Trello could not reach it, nothing is broken — it simply keeps checking on the timer.

15 Optional: pick your commission board

Under **Commission board**, choose the board from step 1. A row appears for each of its lists; choose which status each list means, or leave it on **not a status**. Press **Save commission board**. The Commissions page now shows that board.

WHERE IT GOES IN PAWPOLLER

Settings → Trello → API key + Token (+ Secret for live updates)

KEEPING IT ALIVE

Only if you revoke the token, or chose an expiry date when you approved it. Generate a new token from the same Power-Up page and paste it into Settings → Trello. You can see and revoke what you have approved at trello.com/my/account, under Applications.

GOOD TO KNOW

- **It works both ways.** Drag a card to another column and the commission follows; change a commission here and the card follows.
- **If you change the same thing in both places, nothing is overwritten.** You are shown both values and which side each came from, and you pick. Until you do, that one field is left alone — everything else keeps syncing.
- **Nothing is ever deleted.** Cards are archived, never deleted. If a card disappears from the board, the commission is kept and simply unlinked. If a lot of cards vanish at once, the sync stops and asks rather than assuming you meant it.
- **Your attachments stay here.** Contracts, reference sheets and WIPs are not uploaded to Trello; the card links back to PawPoller instead.
- **Prices stay in PawPoller.** A card marked as a commission keeps its client, price and notes here; none of it is written onto the card in Trello.
- **Only one PawPoller can drive a board.** If you run both the desktop app and a server, whichever one you set up first keeps the board; the other says so and stays out of the way.

- **If you already made an app the other way**, you do not have to start again. Put any https address you own in the **Iframe connector URL** box — `https://pawpoller.com/` will do. Trello only ever fetches that page if the app declares capabilities, and yours declares none, so it is never loaded. Making a fresh app with the right option chosen is tidier, but either works.
- A card only becomes a commission when you open it and press **Mark as commission** — never on its own.
