PAWPOLLER · GETTING STARTED GUIDE

X / Twitter

Track views/likes/replies and post to X — via your session cookies.

Analytics + Posting | Involved Setup

Open this guide as a PDF ↗

WHAT YOU'LL NEED

- An X account
- Two logged-in cookies: auth_token and ct0

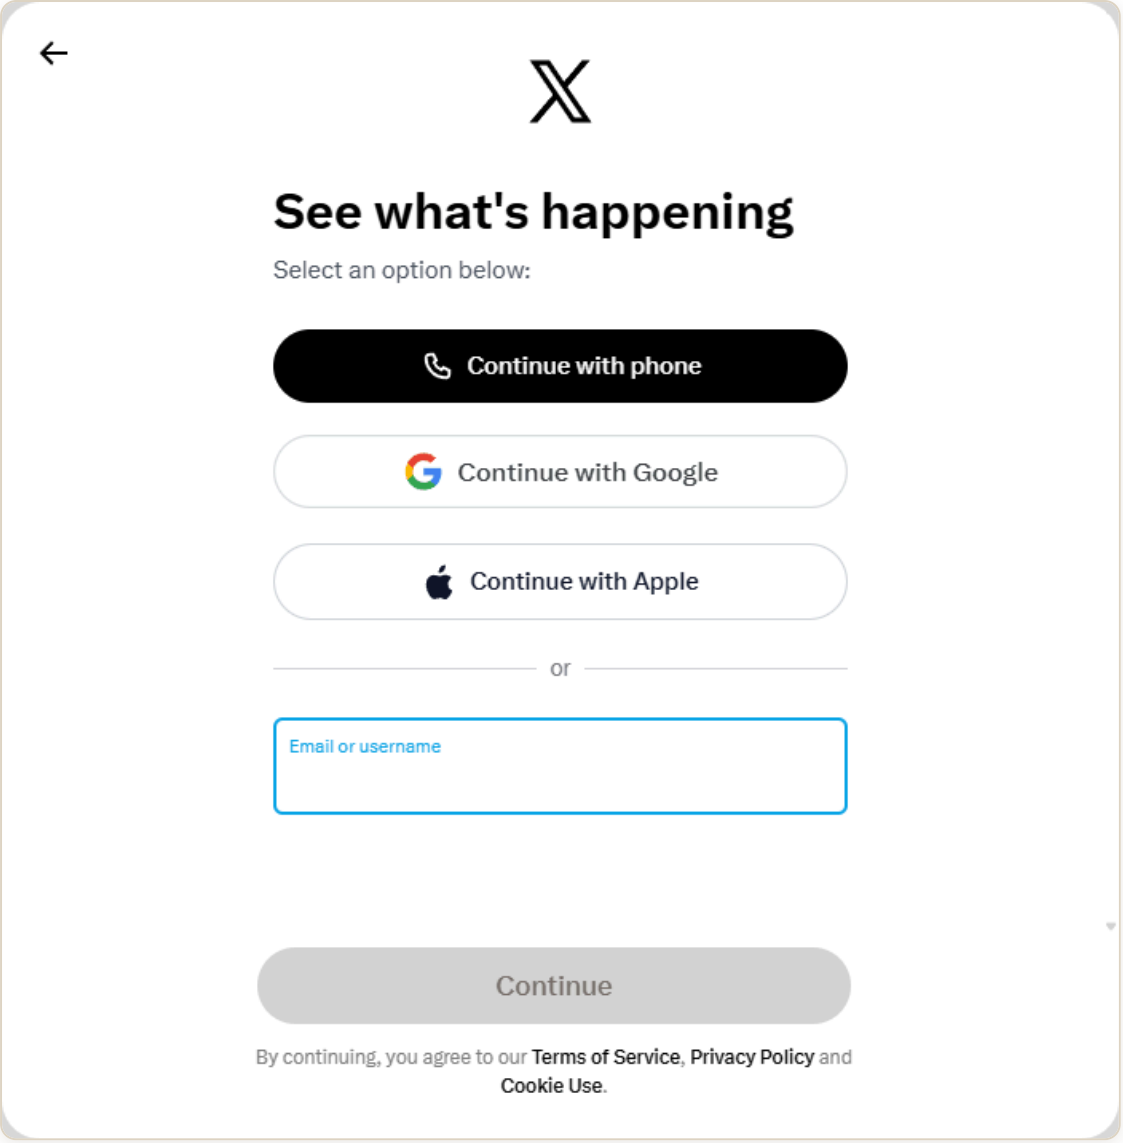

STEP BY STEP

1 **Easiest: press Sign in**

In the PawPoller desktop app, press **Sign in** beside X and sign in in the window that opens. On a server or seat, press **Sign in with the PawPoller app** and follow the code on screen. Then you can skip the rest of these steps.

2 Log into X

Sign in at x.com in a desktop browser. x.com ↗

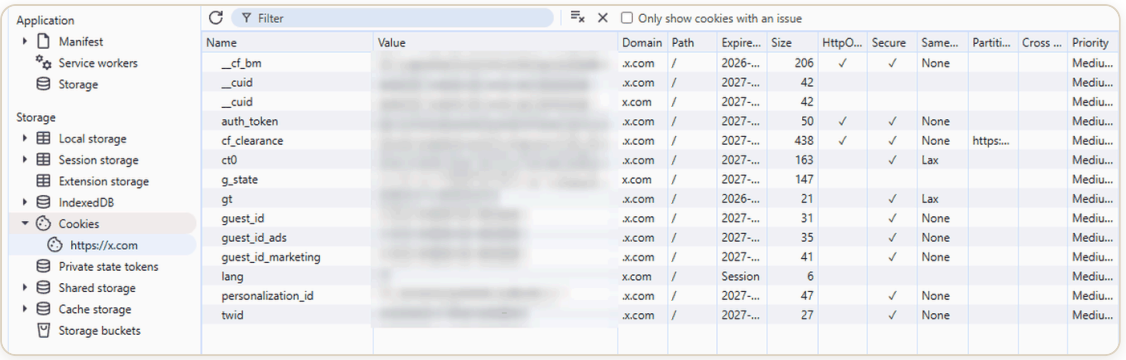

X's sign-in dialog: phone, Google or Apple, or e-mail / username then Continue

3 Open the developer tools

On the X page, press **F12** (on a Mac: **Cmd + Option + I**). A panel opens beside or under the page.

4 Chrome or Edge: open the cookie list

Click the **Application** tab (it may be behind »), then **Cookies** on the left, then the X address under it. A table of names and values appears.

X with DevTools open on Application → Cookies, the auth_token and ct0 rows named, their values blurred here

---

5 Firefox: open the cookie list

Click the **Storage** tab, then **Cookies** on the left, then the X address under it. A table of names and values appears.

---

6 Copy the values

Find the cookies named `auth_token` and `ct0` in the **Name** column. Double-click each one's **Value** and copy it. Treat them like a password: anyone holding them is signed in as you.

---

7 Connect in PawPoller

Paste both cookies and the X username to track in Settings.

WHERE IT GOES IN PAWPOLLER

Settings → X/Twitter → auth_token + ct0 (+ target user)

KEEPING IT ALIVE

X expires these cookies aggressively — expect to re-do this fairly often. Log into X again, grab fresh `auth_token` and `ct0` cookies, and paste them.

GOOD TO KNOW

- X actively fights automation, so this is the most fragile platform — posting can break when X rotates its internal endpoints.
- Posting reuses the same cookie session (no separate developer app needed).
